Abstract

The generalized Forchheimer flows are studied for slightly compressible fluids in porous media with time-dependent Dirichlet boundary data for the pressure. No restrictions on the degree of the Forchheimer polynomial are imposed. We derive, for all time, the interior L^∞ -estimates for the pressure and its partial derivatives, and the interior L^2 -estimates for its Hessian. The De Giorgi and Ladyzhenskaya-Uraltseva iteration techniques are used taking into account the special structures of the equations for both pressure and its gradient. These are combined with the uniform Gronwall-type bounds in establishing the asymptotic estimates when time tends to infinity.

1 Introduction

In this paper, we study the generalized Forchheimer flows for slightly compressible fluids in porous media. Forchheimer equations are used to describe the fluids' dynamics when the ubiquitous Darcy's law is not applicable. They are nonlinear relations between the fluid's velocity and gradient of pressure which were realized by Darcy [3] and Dupuit [7] in early works, formulated by Forchheimer [9,10], and were studied more extensively afterward in physics and engineering, see [2,17,18,21,24] and references therein. Mathematics of Darcy flows has been studied thoroughly with a vast literature for a long time dated back to the 1960s, see the treaty [23] for references. In contrast, Forchheimer flows were investigated mathematically much later in the 1990s. Even less are the mathematical works on compressible Forchheimer flows. The reader is referred to [1,11,12] for more information about this topic.

Generalized Forchheimer equations were proposed and studied in our previous works [1,11–13,15] in order to cover a large class of fluid flows formulated from experiments. For compressible fluids, they form a new class of degenerate parabolic equations with their own characteristics compared to other models of porous medium equations. Among a small number of papers on these flows, recent work [15] is focused on studying the pressure and its time derivative in space L^∞ , the pressure gradient in L^s for $s \in [1, \infty)$ and the pressure's Hessian in $L^{2-\delta}$ for $\delta \in (0, 1)$. However, it requires the so-called Strict Degree Condition (SDC), that is, the degree of the Forchheimer

polynomial is less than $4/(n-2)$, where n is the spatial dimension. Another related paper [13], in contrast, does not require (SDC), but the analysis is mainly for pressure in space L^s , pressure gradient in space L^{2-a} for a specific number $a \in (0, 1)$, and pressure's time derivative in L^2 . Our current work is to unite the two approaches and develop them further without any restrictions on the Forchheimer polynomials. Specifically, we consider the initial boundary value problem (IBVP) for the pressure in a bounded domain with time-dependent Dirichlet boundary data. The interior $W^{1,\infty}$ and $W^{2,2}$ norms of the solutions are estimated, particularly for large time. Such estimates for degenerate parabolic equations usually require much work, see, for e.g., [6, 19, 20, 22]. Improving on [15], we adapt and refine techniques by De Giorgi [4], Ladyzhenskaya-Ural'tseva [16], and also DiBenedetto [5] for parabolic equations, and combine them with those used for Navier-Stokes equations [8]. These techniques are utilized successfully here thanks to the special structure of our equation.

The paper is organized as follows. We recall the model, equations and basic facts in section 2. In section 3, we derive the uniform Gronwall-type estimates that sharpen the previous results in [11, 13] especially for large time. In section 4, the interior L^∞ -estimates for pressure are established by using L^α -based De Giorgi iteration with sufficiently large α . This is different from [15] which is based on the L^2 -estimate and, hence, requires (SDC). As a result, no restrictions on the Forchheimer polynomials are needed for our estimates. In section 5, we first use Ladyzhenskaya-Ural'tseva-type imbedding and iteration to estimate the pressure gradient in L^s for any $s \geq 1$. Our estimates only require the initial data to be in the spaces $W^{1,2-a}$ and L^α for a fixed α . When s is large, this requirement is much less than the $W^{1,s}$ condition in [15]. In subsection 5.2, we derive the $W^{1,\infty}$ estimates for the pressure, which were not previously studied in [13, 15]. We make use of the equation (5.21) for the pressure gradient, which it is highly nonlinear but has a special structure. Thanks to this and previous $W^{1,s}$ ($s < \infty$) bounds, we utilize the De Giorgi technique to obtain the L^∞ -estimates for the pressure gradient. Section 6 contains the L^∞ -estimates for the time derivative of the pressure, while section 7 contains new L^2 -bounds for the pressure's Hessian. It is noteworthy that, thanks to the uniform Gronwall-type inequalities in section 3, the asymptotic bounds obtained as time goes to infinity depend only on the asymptotic behavior of the boundary data. This paper is focused primarily on the interior estimates. The issue of the solutions' estimates on the entire domain is addressed in another work of ours [14].

2 Background

Consider a fluid in a porous medium occupying a bounded domain U with boundary $\Gamma = \partial U$ in space $\mathbb{R}^n$. For physics problem $n = 3$, but here we consider any $n \geq 2$. Let $x \in \mathbb{R}^n$ and $t \in \mathbb{R}$ be the spatial and time variables. The fluid flow has velocity $v(x, t) \in \mathbb{R}^n$, pressure $p(x, t) \in \mathbb{R}$ and density $\rho(x, t) \in [0, \infty)$.

The generalized Forchheimer equations studied in [1, 11–13, 15] are of the the form:

$$g(|v|)v = -\nabla p, \quad (2.1)$$

where $g(s) \geq 0$ is a function defined on $[0, \infty)$. When $g(s) = \alpha, \alpha + \beta s, \alpha + \beta s + \gamma s^2, \alpha + \gamma_m s^{m-1}$, where $\alpha, \beta, \gamma, m, \gamma_m$ are empirical constants, we have Darcy's law, Forchheimer's two-term, three-term and power laws, respectively.

In this paper, we study the case when the function g in (2.1) is a generalized polynomial with non-negative coefficients, that is,

$$g(s) = a_0 s^{\alpha_0} + a_1 s^{\alpha_1} + \dots + a_N s^{\alpha_N} \quad \text{for } s \geq 0, \quad (2.2)$$

where $N \geq 1$, the powers $\alpha_0 = 0 < \alpha_1 < \dots < \alpha_N$ are fixed real numbers (not necessarily integers), the coefficients $a_0, a_1, \dots, a_N$ are non-negative with $a_0 > 0$ and $a_N > 0$. This function $g(s)$ is referred to as the Forchheimer polynomial in equation (2.1), and α_N is the degree of g .

From (2.1) one can solve v implicitly in terms of ∇p and derives a nonlinear version of Darcy's equation:

$$v = -K(|\nabla p|)\nabla p, \quad (2.3)$$

where the function $K : [0, \infty) \rightarrow [0, \infty)$ is defined by

$$K(\xi) = \frac{1}{g(s(\xi))}, \text{ with } s = s(\xi) \geq 0 \text{ satisfying } sg(s) = \xi, \text{ for } \xi \geq 0. \quad (2.4)$$

In addition to (2.1), we have the continuity equation

$$\phi \frac{\partial \rho}{\partial t} + \nabla \cdot (\rho v) = 0, \quad (2.5)$$

where number $\phi \in (0, 1)$ is the constant porosity. Also, for slightly compressible fluids, the equation of state is

$$\frac{d\rho}{dp} = \frac{\rho}{\kappa}, \quad \text{with } \kappa = \text{const.} > 0. \quad (2.6)$$

From (2.3), (2.5) and (2.6) one derives a scalar equation for the pressure:

$$\phi \frac{\partial p}{\partial t} = \kappa \nabla \cdot (K(|\nabla p|)\nabla p) + K(|\nabla p|)|\nabla p|^2. \quad (2.7)$$

On the right-hand side of (2.7), the constant κ is very large for most slightly compressible fluids in porous media [17], hence we neglect its second term and by scaling the time variable, we study the reduced equation

$$\frac{\partial p}{\partial t} = \nabla \cdot (K(|\nabla p|)\nabla p). \quad (2.8)$$

Note that this reduction is commonly used in engineering.

Our aim is to study the IBVP for equation (2.8) in a bounded domain. Here afterward U is a bounded open connected subset of $\mathbb{R}^n$, $n = 2, 3, \dots$ with C^2 boundary $\Gamma = \partial U$. Throughout, the Forchheimer polynomial $g(s)$ is fixed. The following number is frequently used in our calculations:

$$a = \frac{\alpha_N}{1 + \alpha_N} \in (0, 1). \quad (2.9)$$

The function $K(\xi)$ in (2.4) has the following properties (c.f. [1, 11]): it is decreasing in ξ mapping $\xi \in [0, \infty)$ onto $(0, 1/a_0]$, and

$$\frac{C_1}{(1 + \xi)^a} \leq K(\xi) \leq \frac{C_2}{(1 + \xi)^a}, \quad (2.10)$$

$$C_3(\xi^{2-a} - 1) \leq K(\xi)\xi^2 \leq C_2\xi^{2-a}, \quad (2.11)$$

$$-aK(\xi) \leq K'(\xi)\xi \leq 0, \quad (2.12)$$

where C_1, C_2, C_3 are positive constants depending on g . As in previous works, we use the function $H(\xi)$ defined by

$$H(\xi) = \int_0^{\xi^2} K(\sqrt{s})ds \quad \text{for } \xi \geq 0.$$

It satisfies $K(\xi)\xi^2 \leq H(\xi) \leq 2K(\xi)\xi^2$, thus, by (2.11),

$$C_3(\xi^{2-a} - 1) \leq H(\xi) \leq 2C_2\xi^{2-a}. \quad (2.13)$$

The following parabolic Poincaré-Sobolev inequalities are needed for our study. For each $T > 0$, denote $Q_T = U \times (0, T)$. We define a threshold exponent

$$\alpha_* = \frac{an}{2-a}. \quad (2.14)$$

Lemma 2.1. *Assume*

$$\alpha \geq 2 \quad \text{and} \quad \alpha > \alpha_*. \quad (2.15)$$

Let

$$p = \alpha \left(1 + \frac{2-a}{n}\right) - a. \quad (2.16)$$

Then

$$\|u\|_{L^p(Q_T)} \leq C(1 + \delta T)^{1/p} [[u]], \quad (2.17)$$

where $\delta = 1$ in general, $\delta = 0$ in case u vanishes on the boundary ∂U , and

$$[[u]] = \operatorname{ess\,sup}_{[0,T]} \|u(t)\|_{L^\alpha(U)} + \left(\int_0^T \int_U |u|^{\alpha-2} |\nabla u|^{2-a} dx dt \right)^{\frac{1}{\alpha-a}}. \quad (2.18)$$

In case $U = B_R$ – a ball of radius R – the inequality (2.17) holds with

$$[[u]] = R^{\frac{n}{p} - \frac{n}{\alpha}} \operatorname{ess\,sup}_{[0,T]} \|u(t)\|_{L^\alpha(B_R)} + R^{\frac{n}{p} - \frac{n(2-a)}{\alpha-a}} \left(\int_0^T \int_{B_R} |u|^{\alpha-2} |\nabla u|^{2-a} dx dt \right)^{\frac{1}{\alpha-a}} \quad (2.19)$$

and the constant C independent of R .

The proof of Lemma 2.1 is given in Appendix A. The next is a particular embedding with spatial weights from Lemma 2.4 of [15] (see inequality (2.28) with $m = 2$ there).

Lemma 2.2 (cf. [15], Lemma 2.4). *Given $W(x, t) > 0$ on Q_T . Let r be a number that satisfies*

$$\frac{2n}{n+2} < r < 2. \quad (2.20)$$

Set

$$\varrho = \varrho(r) \stackrel{\text{def}}{=} 4(1 - 1/r^*). \quad (2.21)$$

Then

$$\|u\|_{L^\varrho(Q_T)} \leq C[[u]]_{2,W;T} \left\{ \delta T^{\frac{1}{\varrho}} + \operatorname{ess\,sup}_{t \in [0,T]} \left(\int_U W(x, t)^{-\frac{r}{2-r}} \chi_{\operatorname{supp} u}(x, t) dx \right)^{\frac{2-r}{\varrho r}} \right\}, \quad (2.22)$$

where $\delta = 1$ in general, $\delta = 0$ in case u vanishes on the boundary ∂U , and

$$[[u]]_{2,W;T} = \operatorname{ess\,sup}_{[0,T]} \|u(t)\|_{L^2(U)} + \left(\int_0^T \int_U W(x, t) |\nabla u|^2 dx dt \right)^{\frac{1}{2}}. \quad (2.23)$$

The following is a generalization of the convergence of fast decay geometry sequences in Lemma 5.6, Chapter II of [16]. It will be used in the De Giorgi iterations.

Lemma 2.3 (cf. [15], Lemma A.2). *Let $\{Y_i\}_{i=0}^\infty$ be a sequence of non-negative numbers satisfying*

$$Y_{i+1} \leq \sum_{k=1}^m A_k B_k^i Y_i^{1+\mu_k}, \quad i = 0, 1, 2, \dots,$$

where $A_k > 0$, $B_k > 1$ and $\mu_k > 0$ for $k = 1, 2, \dots, m$. Let $B = \max\{B_k : 1 \leq k \leq m\}$ and $\mu = \min\{\mu_k : 1 \leq k \leq m\}$. If $Y_0 \leq \min\{(m^{-1} A_k^{-1} B^{-\frac{1}{\mu}})^{1/\mu_k} : 1 \leq k \leq m\}$ then $\lim_{i \rightarrow \infty} Y_i = 0$.

3 Uniform Gronwall-type estimates

We study the following IBVP for $p(x, t)$:

$$\begin{cases} \frac{\partial p}{\partial t} = \nabla \cdot (K(|\nabla p|)\nabla p) & \text{in } U \times (0, \infty), \\ p(x, 0) = p_0(x) & \text{in } U, \\ p(x, t) = \psi(x, t) & \text{on } \Gamma \times (0, \infty). \end{cases} \quad (3.1)$$

In order to deal with the non-homogeneous boundary condition, the data $\psi(x, t)$ with $x \in \Gamma$ and $t > 0$ is extended to a function $\Psi(x, t)$ with $x \in \bar{U}$ and $t \geq 0$. Throughout, our results are stated in terms of Ψ instead of ψ . Nonetheless, corresponding results in terms of ψ can be retrieved as performed in [11]. The function Ψ is always assumed to have adequate regularities for all calculations in this paper.

It is proved in Section 3 of [13] that (3.1) possesses a weak solution $p(x, t)$ for all $t > 0$. It, in fact, has more regularity in spatial and time variables, see [5]. For the current study, we assume that solution $p(x, t)$ has sufficient regularities both in x and t variables such that our calculations hereafterward can be performed legitimately.

In this section, we obtain improved estimates for solutions of (3.1). We emphasize the asymptotic estimates as $t \rightarrow \infty$ in terms of the asymptotic behavior of $\Psi(x, t)$.

Notation. (a) Hereafter, symbol C is used to denote a positive number independent of the initial and boundary data, and the time variables t, T_0, T ; it may depend on many parameters, namely, exponents and coefficients of polynomial g , the spatial dimension n and domain U , other involved exponents α, s , etc. in calculations. The value of C may vary from place to place, even on the same line. (b) For partial derivative notation, we will alternatively use $\partial p / \partial t = \partial_t p = p_t$, and $\partial p / \partial x_m = \partial_m p = p_{x_m}$. (c) The Lebesgue norm $\|\cdot\|_{L^s}$ means $\|\cdot\|_{L^s(U)}$. (d) For a function $f(x, t)$, we denote by $f(t)$ the function $x \rightarrow f(x, t)$.

For $\alpha \geq 1$, we define

$$A(\alpha, t) = \left[\int_U |\nabla \Psi(x, t)|^{\frac{\alpha(2-a)}{2}} dx \right]^{\frac{2(\alpha-a)}{\alpha(2-a)}} + \left[\int_U |\Psi_t(x, t)|^\alpha dx \right]^{\frac{\alpha-a}{\alpha(1-a)}} \quad (3.2)$$

for $t \geq 0$, and

$$A(\alpha) = \limsup_{t \rightarrow \infty} A(\alpha, t) \quad \text{and} \quad \beta(\alpha) = \limsup_{t \rightarrow \infty} [A'(\alpha, t)]^-. \quad (3.3)$$

Also, define for $\alpha > 0$ the number

$$\hat{\alpha} = \max \{ \alpha, 2, \alpha_* \}. \quad (3.4)$$

Whenever $\beta(\alpha)$ is in use, it is understood that the function $t \rightarrow A(\alpha, t)$ belongs to $C^1((0, \infty))$.

For a function $f : [0, \infty) \rightarrow \mathbb{R}$, we denote by $Env f$ a continuous and increasing function $F : [0, \infty) \rightarrow \mathbb{R}$ such that $F(t) \geq f(t)$ for all $t \geq 0$.

Let $p(x, t)$ be a solution to IBVP (3.1). Denote $\bar{p} = p - \Psi$ and $\bar{p}_0 = p_0 - \Psi(\cdot, 0)$. We recall relevant results from [13] below.

Theorem 3.1 (cf. [13], Theorem 4.3). *Let $\alpha > 0$.*

(i) *For all $t \geq 0$,*

$$\int_U |\bar{p}(x, t)|^\alpha dx \leq C \left(1 + \int_U |\bar{p}_0(x)|^{\hat{\alpha}} dx + [Env A(\hat{\alpha}, t)]^{\frac{\hat{\alpha}}{\hat{\alpha}-a}} \right). \quad (3.5)$$

(ii) If $A(\hat{\alpha}) < \infty$ then

$$\limsup_{t \rightarrow \infty} \int_U |\bar{p}(x, t)|^\alpha dx \leq C(1 + A(\hat{\alpha})^{\frac{\hat{\alpha}}{\hat{\alpha}-a}}). \quad (3.6)$$

(iii) If $\beta(\hat{\alpha}) < \infty$ then there is $T > 0$ such that

$$\int_U |\bar{p}(x, t)|^\alpha dx \leq C(1 + \beta(\hat{\alpha})^{\frac{\hat{\alpha}}{\hat{\alpha}-2a}} + A(\hat{\alpha}, t)^{\frac{\hat{\alpha}}{\hat{\alpha}-a}}) \quad \text{for all } t \geq T. \quad (3.7)$$

For gradient and time derivative estimates, we denote

$$\begin{aligned} G_1(t) &= \int_U |\nabla \Psi(x, t)|^2 dx + \left[\int_U |\Psi_t(x, t)|^{r_0} dx \right]^{\frac{2-a}{r_0(1-a)}} + \left[\int_U |\Psi_t(x, t)|^{r_0} dx \right]^{\frac{1}{r_0}}, \\ G_2(t) &= \int_U |\nabla \Psi_t(x, t)|^2 dx + \int_U |\Psi_t(x, t)|^2 dx, \\ G_3(t) &= G_1(t) + G_2(t), \quad G_4(t) = G_3(t) + \int_U |\Psi_{tt}|^2 dx. \end{aligned}$$

with $r_0 = \frac{n(2-a)}{(2-a)(n+1)-n}$. For $t \geq 0$, recall from (4.20) in [13] and from (3.25) in [11] that

$$\int_0^t \int_U H(|\nabla p(x, \tau)|) dx d\tau \leq C \int_U \bar{p}_0^2(x) dx + C \int_0^t G_1(\tau) d\tau, \quad (3.8)$$

$$\int_U H(|\nabla p(x, t)|) dx + \int_0^t \int_U |\bar{p}_t(x, \tau)|^2 dx d\tau \leq \int_U [H(|\nabla p_0(x)|) + \bar{p}_0^2(x)] dx + C \int_0^t G_3(\tau) d\tau. \quad (3.9)$$

Let $\alpha \geq \hat{2}$. For $t > 0$, applying Theorem 4.5 in [13] with $t_0 = t$ and following Remark 4.8 there to replace $\hat{2}$ by α , we have

$$\begin{aligned} \int_U |\bar{p}_t(x, t)|^2 dx &\leq C \left\{ 1 + \int_U |\bar{p}_0(x)|^\alpha dx + t^{-1} \left(\int_U |\bar{p}_0(x)|^2 dx + H(|\nabla p_0(x)|) dx + \int_0^t G_3(\tau) d\tau \right) \right\} \\ &\quad + C \int_0^t e^{-d_0(t-\tau)} ([EnvA(\alpha, \tau)]^{\frac{\alpha}{\alpha-a}} + G_4(\tau)) d\tau, \end{aligned} \quad (3.10)$$

where $d_0 > 0$ is independent of α . Since $EnvA(\alpha, t)$ is increasing in t , and $G_3 \leq G_4$ we simplify (3.10) as

$$\begin{aligned} \int_U |\bar{p}_t(x, t)|^2 dx &\leq C(1 + t^{-1}) \left(1 + \int_U |\bar{p}_0(x)|^\alpha dx + \int_U H(|\nabla p_0(x)|) dx \right. \\ &\quad \left. + [EnvA(\alpha, t)]^{\frac{\alpha}{\alpha-a}} + \int_0^t G_4(\tau) d\tau \right). \end{aligned} \quad (3.11)$$

Below are improved estimates for time t large by using uniform Gronwall-type inequalities.

Lemma 3.2. For $t \geq 1$,

$$\int_{t-1}^t \int_U H(|\nabla p(x, \tau)|) dx d\tau \leq C \int_U \bar{p}^2(x, t-1) dx + C \int_{t-1}^t G_1(\tau) d\tau, \quad (3.12)$$

$$\int_U H(|\nabla p(x, t)|) dx + \frac{1}{2} \int_{t-1/2}^t \int_U \bar{p}_t^2(x, \tau) dx d\tau \leq C \int_U \bar{p}^2(x, t-1) dx + C \int_{t-1}^t G_3(\tau) d\tau, \quad (3.13)$$

$$\int_U \bar{p}_t^2(x, t) dx \leq C \int_U \bar{p}^2(x, t-1) dx + C \int_{t-1}^t G_4(\tau) d\tau. \quad (3.14)$$

Proof. The proof follows Theorems 4.4 and 4.5 in [12].

Proof of (3.12). Using inequality (3.4) of Lemma 3.1 in [11], one has

$$\frac{d}{dt} \int_U \bar{p}^2(x, t) dx \leq -C \int_U H(|\nabla p|) dx + CG_1(t). \quad (3.15)$$

Dropping the negative term on the right-hand side of (3.15), and integrating it from $t - 1$ to t , we obtain (3.12).

Proof of (3.13). Using (3.17) of Lemma 3.3 in [11] with $\varepsilon = 1$, one has

$$\frac{d}{dt} \int_U H(|\nabla p|) dx \leq - \int_U \bar{p}_t^2(x, t) dx + \int_U H(|\nabla p|) dx + CG_2(t). \quad (3.16)$$

Let $s \in [t - 1, t]$. Integrating (3.16) from s to t we have

$$\begin{aligned} \int_U H(|\nabla p(x, t)|) dx + \int_s^t \int_U \bar{p}_t^2(x, \tau) dx d\tau \\ \leq \int_U H(|\nabla p|)(x, s) dx + \int_s^t \int_U H(|\nabla p|) dx d\tau + C \int_s^t G_2(\tau) d\tau. \end{aligned}$$

Thus,

$$\begin{aligned} \int_U H(|\nabla p(x, t)|) dx + \int_s^t \int_U \bar{p}_t^2(x, \tau) dx d\tau \\ \leq \int_U H(|\nabla p|)(x, s) dx + \int_{t-1}^t \int_U H(|\nabla p|) dx d\tau + C \int_{t-1}^t G_2(\tau) d\tau. \end{aligned} \quad (3.17)$$

Integrating (3.17) in s from $t - 1$ to t , and using (3.12), we obtain

$$\begin{aligned} \int_U H(|\nabla p(x, t)|) dx + \int_{t-1}^t \int_s^t \int_U \bar{p}_t^2(x, \tau) dx d\tau ds \leq 2 \int_{t-1}^t \int_U H(|\nabla p|) dx d\tau + C \int_{t-1}^t G_2(\tau) d\tau \\ \leq C \int_U \bar{p}^2(x, t - 1) dx + C \int_{t-1}^t G_1(\tau) d\tau + C \int_{t-1}^t G_2(\tau) d\tau. \end{aligned} \quad (3.18)$$

Observe that

$$\begin{aligned} \int_{t-1}^t \int_s^t \int_U \bar{p}_t^2(x, \tau) dx d\tau ds &= \int_{t-1}^t \int_{t-1}^\tau \int_U \bar{p}_t^2(x, \tau) dx ds d\tau \\ &\geq \int_{t-1/2}^t \int_{t-1}^\tau \int_U \bar{p}_t^2(x, \tau) dx ds d\tau \geq \frac{1}{2} \int_{t-1/2}^t \int_U \bar{p}_t^2(x, \tau) dx d\tau. \end{aligned}$$

Therefore (3.13) follows from (3.18).

Proof of (3.14). From (3.37) of Proposition 3.11 in [11] we have

$$\frac{d}{dt} \int_U \bar{p}_t^2 dx \leq -C \int_U K(|\nabla p|) |\nabla p_t|^2 dx + C \int_U |\nabla \Psi_t|^2 dx - \int_U \bar{p}_t \Psi_{tt} dx.$$

Dropping the first term on the right-hand side and using Cauchy's inequality give

$$\frac{d}{dt} \int_U \bar{p}_t^2 dx \leq C \int_U |\nabla \Psi_t|^2 dx + \frac{1}{2} \int_U |\bar{p}_t|^2 dx + \frac{1}{2} \int_U |\Psi_{tt}|^2 dx. \quad (3.19)$$

For $s \in [t - 1/2, t]$, integrating (3.19) from s to t gives

$$\begin{aligned} \int_U \bar{p}_t^2(x, t) dx &\leq \int_U \bar{p}_t^2(x, s) dx + C \int_s^t \int_U |\nabla \Psi_t|^2 + |\Psi_{tt}|^2 dx d\tau + \frac{1}{2} \int_s^t \int_U |\bar{p}_t(x, \tau)|^2 dx d\tau, \\ \int_U \bar{p}_t^2(x, t) dx &\leq \int_U \bar{p}_t^2(x, s) dx + C \int_{t-1}^t \int_U |\nabla \Psi_t|^2 + |\Psi_{tt}|^2 dx d\tau + \frac{1}{2} \int_{t-1/2}^t \int_U |\bar{p}_t(x, \tau)|^2 dx d\tau. \end{aligned}$$

Integrating the last inequality in s from $t - 1/2$ to t yields

$$\frac{1}{2} \int_U \bar{p}_t^2(x, t) dx \leq \frac{5}{4} \int_{t-1/2}^t \int_U \bar{p}_t^2(x, s) dx ds + C \int_{t-1}^t \int_U |\nabla \Psi_t|^2 + |\Psi_{tt}|^2 dx d\tau.$$

Using (3.13) for the first integral on the right-hand side, we have

$$\int_U \bar{p}_t^2(x, t) dx \leq C \int_U \bar{p}^2(x, t-1) dx + C \int_{t-1}^t G_3(\tau) d\tau + C \int_{t-1}^t \int_U |\nabla \Psi_t|^2 + |\Psi_{tt}|^2 dx d\tau. \quad (3.20)$$

Using the fact $\int_U |\nabla \Psi_t|^2 dx \leq CG_2(t) \leq CG_3(t)$, we obtain (3.14) from (3.20). The proof is complete. $\square$

Combining the above, we have the following specific estimates which will be used conveniently in subsequent sections.

Corollary 3.3. *Let $\alpha \geq \hat{2}$.*

(i) *For $t \geq 1$,*

$$\int_{t-1}^t \int_U H(|\nabla p(x, \tau)|) dx d\tau \leq C \left(1 + \int_U |\bar{p}_0(x)|^\alpha dx + [EnvA(\alpha, t)]^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_1(\tau) d\tau \right), \quad (3.21)$$

$$\int_{t-1/2}^t \int_U \bar{p}_t^2(x, \tau) dx d\tau \leq C \left(1 + \int_U |\bar{p}_0(x)|^\alpha dx + [EnvA(\alpha, t)]^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_3(\tau) d\tau \right). \quad (3.22)$$

(ii) *If $A(\alpha) < \infty$ then*

$$\limsup_{t \rightarrow \infty} \int_U H(|\nabla p(x, t)|) dx \leq C \left(1 + A(\alpha)^{\frac{\alpha}{\alpha-a}} + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_3(\tau) d\tau \right), \quad (3.23)$$

$$\limsup_{t \rightarrow \infty} \int_U \bar{p}_t^2(x, t) dx \leq C \left(1 + A(\alpha)^{\frac{\alpha}{\alpha-a}} + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_4(\tau) d\tau \right), \quad (3.24)$$

$$\limsup_{t \rightarrow \infty} \int_{t-1}^t \int_U H(|\nabla p(x, \tau)|) dx d\tau \leq C \left(1 + A(\alpha)^{\frac{\alpha}{\alpha-a}} + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_1(\tau) d\tau \right), \quad (3.25)$$

$$\limsup_{t \rightarrow \infty} \int_{t-1/2}^t \int_U \bar{p}_t^2(x, \tau) dx d\tau \leq C \left(1 + A(\alpha)^{\frac{\alpha}{\alpha-a}} + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_3(\tau) d\tau \right). \quad (3.26)$$

(iii) *If $\beta(\alpha) < \infty$ then there is $T > 0$ such that one has for all $t \geq T$ that*

$$\int_U H(|\nabla p(x, t)|) dx \leq C \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + A(\alpha, t-1)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_3(\tau) d\tau \right), \quad (3.27)$$

$$\int_U \bar{p}_t^2(x, t) dx \leq C \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + A(\alpha, t-1)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_4(\tau) d\tau \right), \quad (3.28)$$

$$\int_{t-1}^t \int_U H(|\nabla p(x, \tau)|) dx d\tau \leq C \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + A(\alpha, t-1)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_1(\tau) d\tau \right), \quad (3.29)$$

$$\int_{t-1/2}^t \int_U \bar{p}_t^2(x, \tau) dx d\tau \leq C \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + A(\alpha, t-1)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_3(\tau) d\tau \right). \quad (3.30)$$

Proof. Note that $\hat{\alpha} = \alpha$.

(i) For (3.21), resp. (3.22), we combine (3.12), resp. (3.13), with inequality

$$\int_U \bar{p}^2(x, t-1) dx \leq \int_U (1 + |\bar{p}(x, t-1)|^\alpha) dx, \quad (3.31)$$

and the estimate (3.5) for $t-1$.

(ii) We combine estimates in Lemma 3.2 with (3.31) and the limit (3.6).

(iii) This part is similar to part (ii) with the use of (3.7) in place of (3.6). $\square$

4 Interior L^∞ -estimates for pressure

In this section we estimate the L^∞ -norm of the pressure. *Hereafter, α is a number that satisfies (2.15).* We use κ_j to denote a number of exponents that depend on α . Let

$$\kappa_0 = \alpha(1 + (2-a)/n) - a, \quad \kappa_1 = 1/\delta_1 \quad \text{and} \quad \kappa_2 = 1/\delta_2, \quad (4.1)$$

where $\delta_1 = 1 - \alpha/\kappa_0$ and $\delta_2 = (1 - a/\alpha)(1 - \alpha_*/\alpha)$. Note that $\delta_1, \delta_2 \in (0, 1)$, hence, $\kappa_1, \kappa_2 > 1$.

We start with estimating the L^∞ -norm in terms of the L^α -norm.

Theorem 4.1. *Let $U' \Subset U$. If $T_0 \geq 0$, $T > 0$ and $\theta \in (0, 1)$ then*

$$\sup_{[T_0+\theta T, T_0+T]} \|p(t)\|_{L^\infty(U')} \leq C(1+T)^{\frac{\kappa_1}{\kappa_0}} \left(1 + (\theta T)^{-1} \right)^{\frac{\kappa_1}{\alpha-a}} \left(1 + \|p\|_{L^\alpha(U \times (T_0, T_0+T))} \right)^{\kappa_2}. \quad (4.2)$$

Proof. Without loss of generality, we assume $T_0 = 0$. For $k \geq 0$, define $p^{(k)} = \max\{p - k, 0\}$ and denote by $\chi_k(x, t)$ the characteristic function of the set $\text{supp } p^{(k)}$. Let $\phi_1(x)$ and $\phi_2(t)$ be cut-off functions with $\phi_1 = 1$ on U' , $\phi_1 = 0$ on a neighborhood of ∂U , and $\phi_2(0) = 0$. Let $\zeta(x, t) = \phi_1(x)\phi_2(t)$. Multiplying the first equation in (3.1) by $|p^{(k)}|^{\alpha-1}\zeta^2$ and integrating over U , we have

$$\begin{aligned} & \frac{1}{\alpha} \frac{d}{dt} \int_U |p^{(k)}|^\alpha \zeta^2 dx + (\alpha-1) \int_U K(|\nabla p^{(k)}|) |\nabla p^{(k)}|^2 |p^{(k)}|^{\alpha-2} \zeta^2 dx \\ &= \frac{2}{\alpha} \int_U |p^{(k)}|^\alpha \zeta \zeta_t dx + 2 \int_U K(|\nabla p^{(k)}|) (\nabla p^{(k)} \cdot \nabla \zeta) |p^{(k)}|^{\alpha-1} \zeta dx. \end{aligned}$$

By Cauchy's inequality, we have for the last integral that

$$2|K(|\nabla p^{(k)}|) (\nabla p^{(k)} \cdot \nabla \zeta) |p^{(k)}|^{\alpha-1} \zeta| \leq \frac{\alpha-1}{2} K(|\nabla p^{(k)}|) |\nabla p^{(k)}|^2 |p^{(k)}|^{\alpha-2} \zeta^2 + C K(|\nabla p^{(k)}|) |p^{(k)}|^\alpha |\nabla \zeta|^2.$$

Combining the above, we obtain

$$\begin{aligned} & \frac{1}{\alpha} \frac{d}{dt} \int_U |p^{(k)}|^\alpha \zeta^2 dx + \frac{\alpha-1}{2} \int_U K(|\nabla p^{(k)}|) |\nabla p^{(k)}|^2 |p^{(k)}|^{\alpha-2} \zeta^2 dx \\ & \leq C \int_U |p^{(k)}|^\alpha \zeta |\zeta_t| dx + C \int_U K(|\nabla p^{(k)}|) |p^{(k)}|^\alpha |\nabla \zeta|^2 dx. \end{aligned}$$

Using (2.11), we then have

$$\begin{aligned} & \frac{d}{dt} \int_U |p^{(k)}|^\alpha \zeta^2 dx + \int_U |\nabla p^{(k)}|^{2-a} |p^{(k)}|^{\alpha-2} \zeta^2 dx \\ & \leq C \int_U |p^{(k)}|^\alpha \zeta |\zeta_t| dx + C \int_U K(|\nabla p^{(k)}|) |p^{(k)}|^\alpha |\nabla \zeta|^2 dx + C \int_U |p^{(k)}|^{\alpha-2} \zeta^2 dx. \end{aligned}$$

Using the boundedness of $K(\cdot)$ in the second to last integral, and applying Young's inequality to the last terms yield

$$\begin{aligned} & \frac{d}{dt} \int_U |p^{(k)}|^\alpha \zeta^2 dx + \int_U |\nabla p^{(k)}|^{2-a} |p^{(k)}|^{\alpha-2} \zeta^2 dx \\ & \leq C \int_U |p^{(k)}|^\alpha (\zeta^2 + \zeta |\zeta_t| + |\nabla \zeta|^2) dx + C \int_U \chi_k \zeta^2 dx. \end{aligned}$$

For $t \in [0, T]$, integrating from 0 to T , and taking supremum in t , we obtain

$$\begin{aligned} & \sup_{[0, T]} \int_U |p^{(k)}|^\alpha \zeta^2 dx + \int_0^T \int_U |\nabla p^{(k)}|^{2-a} |p^{(k)}|^{\alpha-2} \zeta^2 dx dt \\ & \leq C \int_0^T \int_U |p^{(k)}|^\alpha (\zeta^2 + \zeta |\zeta_t| + |\nabla \zeta|^2) dx + C \int_0^T \int_U \chi_k \zeta^2 dx. \end{aligned} \quad (4.3)$$

Let x_0 be any given point in $\bar{U}'$. Denote $\rho = \text{dist}(\bar{U}', \partial U) > 0$. Let $M_0 > 0$ be fixed which will be determined later. For $i \geq 0$, define

$$k_i = M_0(1 - 2^{-i}), \quad t_i = \theta T(1 - 2^{-i}), \quad \rho_i = \frac{1}{4}\rho(1 + 2^{-i}). \quad (4.4)$$

Then $t_0 = 0 < t_1 < \dots < \theta T$ and $\rho_0 = \rho/2 > \rho_1 > \dots > \rho/4 > 0$. Note that

$$\lim_{i \rightarrow \infty} t_i = \theta T \quad \text{and} \quad \lim_{i \rightarrow \infty} \rho_i = \rho/4. \quad (4.5)$$

Let $U_i = \{x : \|x - x_0\| < \rho_i\}$ then $U_{i+1} \subseteq U_i$ for $i = 0, 1, 2, \dots$. For $i, j \geq 0$, we denote

$$\mathcal{Q}_i = U_i \times (t_i, T) \quad \text{and} \quad A_{i,j} = \{(x, t) \in \mathcal{Q}_j : p(x, t) > k_i\}. \quad (4.6)$$

For each $\mathcal{Q}_i$, we use a cut-off function $\zeta_i(x, t)$ with $\zeta_i \equiv 1$ in $\mathcal{Q}_{i+1}$ and $\zeta_i \equiv 0$ on $\mathcal{Q}_T \setminus \mathcal{Q}_i$, and

$$|(\zeta_i)_t| \leq \frac{C}{t_{i+1} - t_i} = \frac{C2^{i+1}}{\theta T}, \quad \text{and} \quad |\nabla \zeta_i| \leq \frac{C}{\rho_i - \rho_{i+1}} = \frac{C2^{i+1}}{4\rho}. \quad (4.7)$$

for some $C > 0$. Applying (4.3) with $k = k_{i+1}$ and $\zeta = \zeta_i$ gives

$$\begin{aligned} & \sup_{[0, T]} \int_U |p^{(k_{i+1})}|^\alpha \zeta_i^2 dx + \int_0^T \int_U |\nabla p^{(k_{i+1})}|^{2-a} |p^{(k_{i+1})}|^{\alpha-2} \zeta_i^2 dx dt \\ & \leq \int_0^T \int_U |p^{(k_{i+1})}|^\alpha (\zeta_i^2 + \zeta_i |\zeta_{it}| + |\nabla \zeta_i|^2) dx dt + C \int_0^T \int_U \chi_{k_{i+1}} \zeta_i^2 dx dt. \end{aligned} \quad (4.8)$$

Define

$$F_i \stackrel{\text{def}}{=} \sup_{[t_{i+1}, T]} \int_{U_{i+1}} |p^{(k_{i+1})}|^\alpha dx + \int_{t_{i+1}}^T \int_{U_{i+1}} |\nabla p^{(k_{i+1})}|^{2-a} |p^{(k_{i+1})}|^{\alpha-2} dx dt.$$

Then (4.8) yields

$$\begin{aligned} F_i &\leq \int_{t_i}^T \int_U |p^{(k_{i+1})}|^\alpha (\zeta_i^2 + \zeta_i |\zeta_{it}| + |\nabla \zeta_i|^2) dx dt + C \left(\int_{t_i}^T \int_{U_i} \chi_{k_{i+1}} dx dt \right) \\ &\leq C 4^i ((\theta T)^{-1} + 1) \|p^{(k_{i+1})}\|_{L^\alpha(A_{i+1,i})}^\alpha + C |A_{i+1,i}|. \end{aligned} \quad (4.9)$$

Since $\|p^{(k_i)}\|_{L^\alpha(A_{i,i})} \geq \|p^{(k_i)}\|_{L^\alpha(A_{i+1,i})} \geq (k_{i+1} - k_i) |A_{i+1,i}|^{1/\alpha}$, we have

$$|A_{i+1,i}| \leq (k_{i+1} - k_i)^{-\alpha} \|p^{(k_i)}\|_{L^\alpha(A_{i,i})}^\alpha \leq C 2^{\alpha i} M_0^{-\alpha} \|p^{(k_i)}\|_{L^\alpha(A_{i,i})}^\alpha. \quad (4.10)$$

This and (4.9) imply

$$\begin{aligned} F_i &\leq C 4^i (1 + (\theta T)^{-1}) \|p^{(k_{i+1})}\|_{L^\alpha(A_{i+1,i})}^\alpha + C 2^{\alpha i} M_0^{-\alpha} \|p^{(k_i)}\|_{L^\alpha(A_{i,i})}^\alpha \\ &\leq C 2^{\alpha i} \left(1 + (\theta T)^{-1} + M_0^{-\alpha} \right) \|p^{(k_i)}\|_{L^\alpha(A_{i,i})}^\alpha. \end{aligned} \quad (4.11)$$

Note that κ_0 is the exponent defined in (2.16). Applying Lemma 2.1 to domain U_i , interval $[t_{i+1}, T]$ and function $p^{(k_{i+1})}$ with the use of (2.19), we have

$$\|p^{(k_{i+1})}\|_{L^{\kappa_0}(A_{i+1,i+1})} = \|p^{(k_{i+1})}\|_{L^{\kappa_0}(\mathcal{Q}_{i+1})} \leq C(1+T)^{\frac{1}{\kappa_0}} (F_i^{1/\alpha} + F_i^{1/(\alpha-a)}). \quad (4.12)$$

Note that the constant C depends on ρ . Holder's inequality gives

$$\|p^{(k_{i+1})}\|_{L^\alpha(A_{i+1,i+1})} \leq \|p^{(k_{i+1})}\|_{L^{\kappa_0}(A_{i+1,i+1})} |A_{i+1,i+1}|^{1/\alpha-1/\kappa_0} \leq \|p^{(k_{i+1})}\|_{L^{\kappa_0}(A_{i+1,i+1})} |A_{i+1,i}|^{1/\alpha-1/\kappa_0}.$$

It follows from this, (4.12), (4.11), and (4.10) that

$$\begin{aligned} \|p^{(k_{i+1})}\|_{L^\alpha(A_{i+1,i+1})} &\leq C(1+T)^{\frac{1}{\kappa_0}} (F_i^{1/\alpha} + F_i^{1/(\alpha-a)}) |A_{i+1,i}|^{1/\alpha-1/\kappa_0} \\ &\leq C(1+T)^{\frac{1}{\kappa_0}} B^i \left\{ \left(1 + (\theta T)^{-1} + M_0^{-\alpha} \right)^{1/\alpha} \|p^{(k_i)}\|_{L^\alpha(A_{i,i})} \right. \\ &\quad \left. + \left(1 + (\theta T)^{-1} + M_0^{-\alpha} \right)^{1/(\alpha-a)} \|p^{(k_i)}\|_{L^\alpha(A_i)}^{\alpha/(\alpha-a)} \right\} M_0^{-1+\alpha/\kappa_0} \|p^{(k_i)}\|_{L^2(A_{i,i})}^{1-\alpha/\kappa_0}, \end{aligned}$$

where $B = 2^\alpha$. Now selecting $M_0 \geq 1$ we have

$$\begin{aligned} \|p^{(k_i)}\|_{L^\alpha(A_{i+1,i+1})} &\leq C(1+T)^{\frac{1}{\kappa_0}} B^i \left\{ \left(1 + (\theta T)^{-1} \right)^{1/\alpha} M_0^{-1+\alpha/\kappa_0} \|p^{(k_i)}\|_{L^\alpha(A_{i,i})}^{2-\alpha/\kappa_0} \right. \\ &\quad \left. + \left(1 + (\theta T)^{-1} \right)^{1/(\alpha-a)} M_0^{-1+\alpha/\kappa_0} \|p^{(k_i)}\|_{L^\alpha(A_{i,i})}^{\alpha/(\alpha-a)+1-\alpha/\kappa_0} \right\}. \end{aligned}$$

Denote $Y_i = \|p^{(k_i)}\|_{L^\alpha(A_{i,i})}$. Then

$$Y_{i+1} \leq C B^i \left(D_1 Y_i^{1+\delta_1} + D_2 Y_i^{1+\nu_1} \right),$$

where $\delta_1 > 0$ is defined in (4.1), $\nu_1 = \alpha/(\alpha-a) - \alpha/\kappa_0 > 0$,

$$D_1 = (1+T)^{\frac{1}{\kappa_0}} \left(1 + (\theta T)^{-1} \right)^{1/\alpha} M_0^{-\delta_1}, \quad \text{and} \quad D_2 = (1+T)^{\frac{1}{\kappa_0}} \left(1 + (\theta T)^{-1} \right)^{1/(\alpha-a)} M_0^{-\delta_1}.$$

Take M_0 sufficiently large such that

$$Y_0 \leq C \min\{D_1^{-1/\delta_1}, D_2^{-1/\nu_1}\}. \quad (4.13)$$

Then by Lemma 2.3, $\lim_{i \rightarrow \infty} Y_i = 0$, consequently, $\int_{\theta T}^T \int_{B_{\rho/4}(x_0)} |p^{(M_0)}|^\alpha dx dt = 0$, that is

$$p(x, t) \leq M_0 \quad \text{a.e. in } B_{\rho/4}(x_0) \times (\theta T, T).$$

Since $Y_0 \leq \|p\|_{L^\alpha(Q_T)}$, condition (4.13) is met if $\|p\|_{L^\alpha(Q_T)} \leq C \min\{D_1^{-1/\delta_1}, D_2^{-1/\nu_1}\}$. This, in turn, is satisfied if

$$M_0 \geq C(1+T)^{\frac{1}{\kappa_0\delta_1}} \left\{ (1+(\theta T)^{-1})^{1/(\alpha\delta_1)} \|p\|_{L^\alpha(Q_T)} + (1+(\theta T)^{-1})^{1/((\alpha-a)\delta_1)} \|p\|_{L^\alpha(Q_T)}^{\nu_1/\delta_1} \right\}.$$

Note that $\nu_1/\delta_1 = 1/\delta_2 = \kappa_2 > 1$. Combining this and condition $M_0 \geq 1$ we choose

$$M_0 = C(1+T)^{\frac{\kappa_1}{\kappa_0}} (1+\theta T)^{-1} (1+\theta T)^{\frac{\kappa_1}{\alpha-a}} (1+\|p\|_{L^\alpha(Q_T)})^{\kappa_2},$$

with an appropriate positive constant C . By using a finite covering of $\bar{U}'$, we obtain

$$p(x, t) \leq M_0 \quad \text{a.e. in } U' \times (\theta T, T).$$

Repeating the argument for $-p$ instead of p , we obtain $|p(x, t)| \leq M_0$ a.e. in $U' \times [\theta T, T]$, and hence (4.2) follows. The proof is complete. $\square$

Combining Theorem 4.1 with estimates in Section 3, we obtain the following specific estimates for the L^∞ -norm.

Theorem 4.2. *Let $U' \Subset U$.*

(i) *If $t \in (0, 1)$ then*

$$\|p(t)\|_{L^\infty(U')} \leq C t^{-\frac{\kappa_1}{\alpha-a}} \left(1 + \|\bar{p}_0\|_{L^\alpha} + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))} \right)^{\kappa_2}. \quad (4.14)$$

If $t \geq 1$ then

$$\|p(t)\|_{L^\infty(U')} \leq C \left(1 + \|\bar{p}_0\|_{L^\alpha} + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\kappa_2}. \quad (4.15)$$

(ii) *If $A(\alpha) < \infty$ then*

$$\limsup_{t \rightarrow \infty} \|p(t)\|_{L^\infty(U')} \leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\kappa_2}. \quad (4.16)$$

(iii) *If $\beta(\alpha) < \infty$ then there is $T > 0$ such that*

$$\|p(t)\|_{L^\infty(U')} \leq C \left(1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \|A(\alpha, \cdot)\|_{L^{\frac{\alpha}{\alpha-a}}(t-1, t)}^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\kappa_2} \quad (4.17)$$

for all $t \geq T$.

Proof. (i) Note that $\alpha = \hat{\alpha}$. Let $t \in (0, 1)$. Applying (4.2) for $T = t$ and $\theta = 1/2$, we have

$$\begin{aligned} \|p(t)\|_{L^\infty(U')} &\leq C(1+t^{-\frac{\kappa_1}{\alpha-a}})(1+\|p\|_{L^\alpha(U \times (0, t))}^{\kappa_2}) \\ &\leq C t^{-\frac{\kappa_1}{\alpha-a}} (1 + \|\bar{p}\|_{L^\alpha(U \times (0, t))} + \|\Psi\|_{L^\alpha(U \times (0, t))})^{\kappa_2}. \end{aligned}$$

Using (3.5) to estimate $\|\bar{p}\|_{L^\alpha(U \times (0, t))}$ and the fact that $EnvA(\alpha, t)$ is increasing in t , we obtain (4.14).

For $t \geq 1$, applying (4.2) with $T_0 = t - 1$, $T = 1$ and $\theta = 1/2$ we obtain

$$\|p(t)\|_{L^\infty(U')} \leq C \left(1 + \|p\|_{L^\alpha(U \times (t-1, t))}^{\kappa_2} \right) \leq C \left(1 + \|\bar{p}\|_{L^\alpha(U \times (t-1, t))} + \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\kappa_2}. \quad (4.18)$$

Again, using inequality (3.5) to estimate $\|\bar{p}\|_{L^\alpha(U \times (t-1, t))}$, we obtain (4.15).

(ii) From (4.18) we have

$$\limsup_{t \rightarrow \infty} \|p(t)\|_{L^\infty(U')} \leq C \left(1 + \limsup_{t \rightarrow \infty} \|\bar{p}\|_{L^\alpha(U \times (t-1, t))} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\kappa_2}.$$

By (3.6),

$$\limsup_{t \rightarrow \infty} \|\bar{p}\|_{L^\alpha(U \times (t-1, t))}^\alpha \leq \limsup_{t \rightarrow \infty} \int_U |\bar{p}(x, t)|^\alpha dx \leq C(1 + A(\alpha))^{\alpha/(\alpha-a)}.$$

Thus (4.16) follows.

(iii) By (3.7), we have for large t that

$$\int_{t-1}^t \int_U |\bar{p}(x, \tau)|^\alpha dx d\tau \leq C \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + \int_{t-1}^t A(\alpha, \tau)^{\frac{\alpha}{\alpha-a}} d\tau \right). \quad (4.19)$$

From (4.18) and (4.19), we obtain (4.17). $\square$

It is worthy to mention that the quantities on the right-hand sides of estimates (4.16) and (4.17) only depend on the boundary data's large time behavior. This feature will be re-established in many of our estimates below for the gradient, time derivative and Hessian of the pressure.

5 Interior estimates for pressure gradient

We will first estimate the pressure gradient in L^s -norm (for $s < \infty$) in subsection 5.1, and then in L^∞ -norm in subsection 5.2.

5.1 L^s -estimates

The following imbedding lemma from [15] is a suitable extension of Lemma 5.4 on page 93 in [16].

Lemma 5.1 (cf. [15], Lemma 3.2). *For each $s \geq 1$, there exists a constant $C > 0$ depending on s such that for each smooth cut-off function $\zeta(x) \in C_c^\infty(U)$, the following inequality holds*

$$\begin{aligned} \int_U K(|\nabla p|) |\nabla p|^{2s+2} \zeta^2 dx &\leq C \max_{\text{supp } \zeta} |p|^2 \left[\int_U K(|\nabla p|) |\nabla p|^{2s-2} |\nabla^2 p|^2 \zeta^2 dx \right. \\ &\quad \left. + \int_U K(|\nabla p|) |\nabla p|^{2s} |\nabla \zeta|^2 dx \right], \end{aligned}$$

for every sufficiently regular function $p(x)$ such that the right hand side is well-defined.

We establish the basic step for the Ladyzhenskaya-Ural'tseva iteration.

Lemma 5.2. *For each $s \geq 0$, if $T_0 \geq 0$, $T > 0$, and $\zeta(x, t)$ is a smooth function with $\zeta(\cdot, T_0) = 0$ and $\text{supp } \zeta(\cdot, t) \subset U$ for all $t \in [T_0, T_0 + T]$, then*

$$\begin{aligned} \sup_{[T_0, T_0+T]} \int_U |\nabla p(x, t)|^{2s+2} \zeta^2 dx + \int_{T_0}^{T_0+T} \int_U K(|\nabla p|) |\nabla^2 p|^2 |\nabla p|^{2s} \zeta^2 dx dt \\ \leq C \int_{T_0}^{T_0+T} \int_U K(|\nabla p|) |\nabla p|^{2s+2} |\nabla \zeta|^2 dx dt + C \int_{T_0}^{T_0+T} \int_U |\nabla p|^{2s+2} \zeta |\zeta_t| dx. \end{aligned} \quad (5.1)$$

Proof. Without loss of generality, assume $T_0 = 0$. Multiplying the equation (3.1) by $-\nabla \cdot (|\nabla p|^{2s} \zeta^2 \nabla p)$, integrating the resultant over U and using integration by parts, we obtain

$$\frac{1}{2s+2} \frac{d}{dt} \int_U |\nabla p|^{2s+2} \zeta^2 dx = - \int_U \partial_j (K(|\nabla p|) \partial_i p) \partial_i (|\nabla p|^{2s} \partial_j p \zeta^2) dx + \frac{1}{s+1} \int_U |\nabla p|^{2s+2} \zeta \zeta_t dx.$$

Calculated as in Lemma 3.1 of [15] above equation is rewritten as

$$\begin{aligned} \frac{1}{2s+2} \frac{d}{dt} \int_U |\nabla p|^{2s+2} \zeta^2 dx &= - \int_U \left[\partial_{y_l} (K(|y|) y_i) \Big|_{y=\nabla p} \partial_j \partial_l p \right] \partial_j \partial_i p |\nabla p|^{2s} \zeta^2 dx \\ &\quad - 2 \int_U \left[\partial_{y_l} (K(|y|) y_i) \Big|_{y=\nabla p} \partial_j \partial_l p \right] \partial_j p |\nabla p|^{2s} \zeta \partial_i \zeta dx \\ &\quad - 2s \int_U \left[\partial_{y_l} (K(|y|) y_i) \Big|_{y=\nabla p} \partial_j \partial_l p \right] \partial_j p (|\nabla p|^{2s-2} \partial_i \partial_m p \partial_m p) \zeta^2 dx + \frac{1}{s+1} \int_U |\nabla p|^{2s+2} \zeta \zeta_t dx. \end{aligned}$$

We denote the four terms on the right-hand side by I_1 , I_2 , I_3 and I_4 . It follows from the calculations in Lemma 3.1 of [15] that

$$\begin{aligned} I_1 &\leq -(1-a) \sum_j \int_U K(|\nabla p|) |\nabla(\partial_j p)|^2 |\nabla p|^{2s} \zeta^2 dx, \\ |I_2| &\leq 2(1+a) \int_U K(|\nabla p|) |\nabla^2 p| |\nabla p|^{2s+1} \zeta |\nabla \zeta| dx, \end{aligned}$$

and

$$I_3 \leq -2(1-a)s \int_U K(|\nabla p|) \left| \nabla \left(\frac{1}{2} |\nabla p|^2 \right) \right|^2 |\nabla p|^{2s-2} \zeta^2 dx \leq 0.$$

Combining these estimates with Young's inequality, we find that

$$\begin{aligned} \frac{1}{2s+2} \frac{d}{dt} \int_U |\nabla p|^{2s+2} \zeta^2 dx &+ \frac{1-a}{2} \int_U K(|\nabla p|) |\nabla^2 p|^2 |\nabla p|^{2s} \zeta^2 dx \\ &\leq C \int_U K(|\nabla p|) |\nabla p|^{2s+2} |\nabla \zeta|^2 dx + \frac{1}{s+1} \int_U |\nabla p|^{2s+2} \zeta |\zeta_t| dx. \end{aligned} \quad (5.2)$$

Inequality (5.1) follows directly by integrating (5.2) from 0 to T . $\square$

Next, we reduce estimates for $W^{1,s}$ -norm, with large s , down to $W^{1,2-a}$ and L^∞ norms.

Proposition 5.3. *Let $U' \Subset V \Subset U$, $T_0 \geq 0$, $T > 0$ and $\theta \in (0, 1)$. If $s \geq 2$ then*

$$\begin{aligned} \int_{T_0+\theta T}^{T_0+T} \int_{U'} K(|\nabla p|) |\nabla p|^s dx dt &\leq C \left(1 + (\theta T)^{-1} \right)^{s-2} \left(1 + \sup_{[T_0+\theta T/2, T_0+T]} \|p\|_{L^\infty(V)}^2 \right)^{s-2} \\ &\quad \cdot \int_{T_0}^{T_0+T} \int_U (1 + K(|\nabla p|) |\nabla p|^2) dx dt, \end{aligned} \quad (5.3)$$

and

$$\begin{aligned} \sup_{t \in [T_0+\theta T, T_0+T]} \int_{U'} |\nabla p(x, t)|^s dx dt &\leq C \left(1 + (\theta T)^{-1} \right)^{s+a-1} \left(1 + \sup_{[T_0+\theta T/2, T_0+T]} \|p\|_{L^\infty(V)}^2 \right)^{s-2+a} \\ &\quad \cdot \int_{T_0}^{T_0+T} \int_U (1 + K(|\nabla p|) |\nabla p|^2) dx dt, \end{aligned} \quad (5.4)$$

where constant $C > 0$ is independent of T_0 , T , and θ .

Proof. Without loss of generality, assume $T_0 = 0$. First, we prove a more general version of (5.3).

Claim. For $0 < \theta' < \theta < 1$ we have

$$\int_{\theta T}^T \int_{U'} K(|\nabla p|) |\nabla p|^s dx dt \leq C \left(1 + [(\theta - \theta')T]^{-1}\right)^{s-2} \left(1 + \sup_{[\theta' T, T]} \|p\|_{L^\infty(V)}^2\right)^{s-2} \cdot \int_0^T \int_U (1 + K(|\nabla p|) |\nabla p|^2) dx dt, \quad (5.5)$$

where constant $C > 0$ is independent of T , θ , and θ' .

Note that (5.5) holds trivially when $s = 2$. Hence, we will only prove (5.5) for $s > 2$ in a number of steps.

Step 1. Let $\zeta(x, t)$ be the cut-off function with $\zeta(x, t) = 0$ for $(x, t) \notin V \times (\theta' T, T]$ and $\zeta(x, t) = 1$ for $(x, t) \in U' \times (\theta T, T]$. By applying Lemma 5.1 with $s + 1$ in place of s , we have for $s \geq 0$ that

$$\begin{aligned} \int_0^T \int_U K(|\nabla p|) |\nabla p|^{2s+4} \zeta^2 dx dt &\leq C \max_{\text{supp } \zeta} |p|^2 \left[\int_0^T \int_U K(|\nabla p|) |\nabla p|^{2s} |\nabla^2 p|^2 \zeta^2 dx dt \right. \\ &\quad \left. + \int_0^T \int_U K(|\nabla p|) |\nabla p|^{2s+2} |\nabla \zeta|^2 dx dt \right]. \end{aligned}$$

Let $N_0 = \sup_{V \times [\theta' T, T]} |p|^2$. Using (5.1) to estimate the first integral on the right-hand side, we find that

$$\begin{aligned} \int_0^T \int_U K(|\nabla p|) |\nabla p|^{2s+4} \zeta^2 dx dt \\ \leq C N_0 \left[\int_0^T \int_U K(|\nabla p|) |\nabla p|^{2s+2} |\nabla \zeta|^2 dx dt + \int_0^T \int_U |\nabla p|^{2s+2} \zeta |\zeta_t| dx \right]. \end{aligned} \quad (5.6)$$

By the boundedness and property (2.10) of function $K(\xi)$,

$$\begin{aligned} K(|\nabla p|) |\nabla p|^{2s+2} &\leq C |\nabla p|^{2s+2} \leq C K(|\nabla p|) (1 + |\nabla p|^a) |\nabla p|^{2s+2} \\ &\leq C K(|\nabla p|) (1 + |\nabla p|^{2s+2+a}) \leq C (1 + K(|\nabla p|) |\nabla p|^{2s+2+a}). \end{aligned} \quad (5.7)$$

Hence, inequality (5.6) leads to

$$\int_0^T \int_U K(|\nabla p|) |\nabla p|^{2s+4} \zeta^2 dx dt \leq C N_0 \int_0^T \int_U (1 + K(|\nabla p|) |\nabla p|^{2s+2+a}) (|\nabla \zeta|^2 + \zeta |\zeta_t|) dx dt. \quad (5.8)$$

Step 2. Let $s = 0$ in (5.6). For $\varepsilon > 0$, applying Cauchy's inequality to the last integral of (5.6) gives

$$\begin{aligned} \int_0^T \int_U K(|\nabla p|) |\nabla p|^4 \zeta^2 dx &\leq \varepsilon N_0 \int_0^T \int_U K(|\nabla p|) |\nabla p|^4 \zeta^2 dx + C \varepsilon^{-1} N_0 \int_0^T \int_U K(|\nabla p|)^{-1} \zeta_t^2 dx dt \\ &\quad + C N_0 \int_0^T \int_U K(|\nabla p|) |\nabla p|^2 |\nabla \zeta|^2 dx dt. \end{aligned} \quad (5.9)$$

Here, the cut-off function ζ satisfies $|\nabla \zeta| \leq C$ and $0 \leq \zeta_t \leq C[(\theta - \theta')T]^{-1}$. Taking $\varepsilon = (2(N_0 + 1))^{-1}$

in (5.9) and using Young's inequality yield

$$\begin{aligned} \int_{\theta T}^T \int_{U'} K(|\nabla p|)|\nabla p|^4 dxdt &\leq C(N_0 + 1)N_0((\theta - \theta')T)^{-2} \int_{\theta' T}^T \int_U (1 + |\nabla p|)^a dxdt \\ &\quad + CN_0 \int_{\theta' T}^T \int_U K(|\nabla p|)|\nabla p|^2 dxdt \\ &\leq C(1 + N_0)^2 \left(1 + \frac{1}{(\theta - \theta')T}\right)^2 \int_{\theta' T}^T \int_U (1 + K(|\nabla p|)|\nabla p|^2) dxdt. \end{aligned}$$

This implies (5.5) when $s = 4$.

Step 3. When $s \in (2, 4)$, let β be a number in $(0, 1)$ such that $\frac{1}{s} = \frac{1-\beta}{2} + \frac{\beta}{4}$. Then, by interpolation inequality:

$$\left(\int_{\theta T}^T \int_{U'} K(|\nabla p|)|\nabla p|^s dxdt \right)^{\frac{1}{s}} \leq \left(\int_{\theta T}^T \int_U K(|\nabla p|)|\nabla p|^2 dxdt \right)^{\frac{1-\beta}{2}} \left(\int_{\theta T}^T \int_{U'} K(|\nabla p|)|\nabla p|^4 dxdt \right)^{\frac{\beta}{4}}.$$

Note that $\beta s/4 = s/2 - 1$. Using (5.9) to estimate the last double integral, we obtain

$$\int_{\theta T}^T \int_{U'} K(|\nabla p|)|\nabla p|^s dxdt \leq C \left(1 + \frac{1}{(\theta - \theta')T}\right)^{s-2} (1 + N_0)^{s-2} \int_{\theta' T}^T \int_U (1 + K(|\nabla p|)|\nabla p|^2) dx. \quad (5.10)$$

This implies (5.5) for $s \in (2, 4)$. Therefore, we have proved (5.5) for $s \in (2, 4]$.

Step 4. When $s > 4$, let m be the positive integer that satisfies $\frac{s-4}{2-a} \leq m < \frac{s-4}{2-a} + 1$, then $s - m(2-a) \in (2, 4]$. Then, let $\{U_k\}_{k=0}^m$ and $\{V_k\}_{k=0}^m$ be two families of open subsets of U such that

$$U' = U_0 \Subset V_0 \Subset U_1 \Subset V_1 \Subset U_2 \Subset V_2 \Subset \dots \Subset U_{m-1} \Subset V_{m-1} \Subset U_m \Subset V_m = V \Subset U.$$

For each $k = 0, 1, \dots, m+1$, let $\theta_k = \theta - (\theta - \theta')k/(m+1)$. Note that $\theta = \theta_0 > \theta_1 > \theta_2 > \dots > \theta_m > \theta_{m+1} = \theta'$ and $\theta_k - \theta_{k+1} = (\theta - \theta')/(m+1)$. For $1 \leq k \leq m$, let $\zeta_k(x, t)$ be a smooth cut-off function which is equal to one on $U_k \times (t_k, T]$ and zero on $Q_T \setminus V_k \times (t_{k-1}, T]$, and satisfies $|\nabla \zeta_k| \leq C_m$ and $0 \leq \zeta_{k,t} \leq C_m[(\theta - \theta')T]^{-1}$. Here and in the following calculations in this proof, C_m denotes a generic positive constant depending on all U_k and V_k , $k = 1, 2, \dots, m$.

We denote $N_0 = \sup_{V \times [\theta' T, T]} |p|^2$ still. Applying (5.8) to V_0, U_1, θ_1 in place of V, U, θ , we have

$$\begin{aligned} \int_{\theta T}^T \int_{U'} K(|\nabla p|)|\nabla p|^s dxdt &\leq C_m(1 + [(\theta - \theta')T]^{-1})N_0 \int_{\theta_1 T}^T \int_{U_1} (1 + K(|\nabla p|)|\nabla p|^{s-(2-a)}) dxdt \\ &= C_m(1 + [(\theta - \theta')T]^{-1})N_0 \left[T + \int_{\theta_1 T}^T \int_{U_1} K(|\nabla p|)|\nabla p|^{s-(2-a)} dxdt \right]. \end{aligned}$$

Above, we used the fact that $\sup_{V_k \times [\theta_{k-1} T, T]} |p|^2 \leq N_0$ for $1 \leq k \leq m$. Applying (5.8) recursively to $U_k \Subset V_k \Subset U_{k+1}$ and $\theta_k > \theta_{k+1}$, we obtain

$$\begin{aligned} \int_{\theta T}^T \int_{U'} K(|\nabla p|)|\nabla p|^s dxdt &\leq C_m T \sum_{i=1}^m d^i + C d^m \int_{\theta_m T}^T \int_{U_m} K(|\nabla p|)|\nabla p|^{s-m(2-a)} dxdt \\ &\leq C_m d^m \left[T + \int_{\theta_m T}^T \int_{U_m} K(|\nabla p|)|\nabla p|^{s-m(2-a)} dxdt \right], \end{aligned}$$

where $d = (1 + [(\theta - \theta')T]^{-1})(1 + N_0)$. Since $s - m(2-a) \in (2, 4]$, estimating the last integral by (5.10) gives

$$\int_{\theta T}^T \int_{U'} K(|\nabla p|)|\nabla p|^s dxdt \leq C d^m T + C d^{s-m(2-a)-2+m} \int_{\theta' T}^T \int_U K(|\nabla p|)|\nabla p|^2 dx. \quad (5.11)$$

Since $d \geq 1$ and $m, s - m(2 - a) - 2 + m \leq s - 2$, the desired estimate (5.5) follows (5.11). This completes the proof of (5.5) for all $s \geq 2$.

The inequality (5.3) then is an obvious consequence of (5.5) with $\theta' = \theta/2$.

Now, we turn to the proof of (5.4). For $s > 2 - a$, it follows from (5.1) that

$$\begin{aligned} \sup_{[0,T]} \int_U |\nabla p|^s \zeta^2 dx &\leq C \int_0^T \int_U K(|\nabla p|) |\nabla p|^s |\nabla \zeta|^2 dx dt + C \int_0^T \int_U |\nabla p|^s \zeta |\zeta_t| dx \\ &\leq C \int_0^T \int_U |\nabla p|^s (|\nabla \zeta|^2 + \zeta |\zeta_t|) dx dt. \end{aligned}$$

Same as (5.7), we have $|\nabla p|^s \leq C(1 + K(|\nabla p|)|\nabla p|^{s+a})$, and hence

$$\sup_{[0,T]} \int_U |\nabla p|^s \zeta^2 dx \leq C \int_0^T \int_U (1 + K(|\nabla p|)|\nabla p|^{s+a})(|\nabla \zeta|^2 + \zeta |\zeta_t|) dx. \quad (5.12)$$

Let V' be an open set such that $U' \Subset V' \Subset V$. Choose $\zeta(x, t)$ such that $\zeta = 0$ for $t \leq 3\theta T/4$ or $x \notin V'$, and $\zeta = 1$ for $(x, t) \in U' \times [\theta T, T]$. Then we have from (5.12) that

$$\sup_{[\theta T, T]} \int_U |\nabla p|^s dx \leq C(1 + (\theta T)^{-1}) \int_{3\theta T/4}^T \int_{V'} (1 + K(|\nabla p|)|\nabla p|^{s+a}) dx dt. \quad (5.13)$$

To estimate the last integral, we apply (5.5) with parameters s, θ', θ, U' being replaced by $s + a, \theta/2, 3\theta/4, V'$. Therefore, we obtain

$$\sup_{[\theta T, T]} \int_{U'} |\nabla p|^s dx \leq C \left\{ ((1 + (\theta T)^{-1})^{s+a-1} (1 + N_0)^{s+a-2} \int_0^T \int_U 1 + K(|\nabla p|)|\nabla p|^2 dx dt) \right\},$$

hence proving (5.4). The proof is complete. $\square$

Now, we combine Proposition 5.3 with estimates in section 3 to express the bounds in terms of the initial and boundary data.

Theorem 5.4. *Let $U' \Subset U$ and $s \geq 2$. If $t \in (0, 2)$ then*

$$\begin{aligned} \int_{U'} |\nabla p(x, t)|^s dx &\leq C t^{-\mu_1} (1 + \|\bar{p}_0\|_{L^\alpha})^{\mu_2+2} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))} \right)^{\mu_2} \\ &\quad \cdot \left(1 + \int_0^t G_1(\tau) d\tau \right), \end{aligned} \quad (5.14)$$

where

$$\mu_1 = \mu_1(\alpha, s) \stackrel{\text{def}}{=} \left[1 + \frac{2\kappa_1}{\alpha - a} \right] (s + a - 2) + 1 \quad \text{and} \quad \mu_2 = \mu_2(\alpha, s) \stackrel{\text{def}}{=} 2\kappa_2(s - 2 + a). \quad (5.15)$$

If $t \geq 2$ then

$$\begin{aligned} \int_{U'} |\nabla p(x, t)|^s dx &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{\mu_2+\alpha} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))} \right)^{\mu_2+\alpha} \\ &\quad \cdot \left(1 + \int_{t-1}^t G_1(\tau) d\tau \right). \end{aligned} \quad (5.16)$$

Proof. Let $t \in (0, 2)$. Applying (5.4) to $T_0 = 0$, $T = t$ and $\theta = 1/2$, and using (4.14), (3.8) and relation (2.13), we obtain

$$\begin{aligned} \int_{U'} |\nabla p(x, t)|^s dx &\leq Ct^{-\mu_1} \cdot \left(1 + \|\bar{p}_0\|_{L^\alpha} + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))}\right)^{2\kappa_2(s-2+a)} \\ &\quad \cdot \left(1 + \|\bar{p}_0\|_{L^2}^2 + \int_0^t G_1(\tau) d\tau\right). \end{aligned}$$

Then (5.14) follows. Let $t \geq 2$. Applying (5.4) with $T_0 = t - 1$, $T = 1$, $\theta = 1/2$, then combining it with (4.15) and (3.21), we obtain

$$\begin{aligned} \int_{U'} |\nabla p(x, t)|^s dx &\leq C \left(1 + \|\bar{p}_0\|_{L^\alpha} + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))}\right)^{\mu_2} \\ &\quad \cdot \left(1 + \|\bar{p}_0\|_{L^\alpha}^\alpha + EnvA(\alpha, t)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_1(\tau) d\tau\right). \end{aligned}$$

Then (5.16) follows. $\square$

For large time estimates, we have:

Theorem 5.5. *Let $U' \Subset U$, $s \geq 2$, and let μ_2 be defined as in Theorem 5.4.*

(i) *If $A(\alpha) < \infty$ then*

$$\limsup_{t \rightarrow \infty} \int_{U'} |\nabla p(x, t)|^s dx \leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))}\right)^{\mu_2 + \alpha} \left(1 + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_1(\tau) d\tau\right). \quad (5.17)$$

(ii) *If $\beta(\alpha) < \infty$ then there is $T > 0$ such that for all $t > T$,*

$$\int_{U'} |\nabla p(x, t)|^s dx \leq C \left(1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \sup_{[t-2, t]} A(\alpha, \cdot)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))}\right)^{\mu_2 + \alpha} \left(1 + \int_{t-1}^t G_1(\tau) d\tau\right). \quad (5.18)$$

Proof. For $t \geq 1$ Applying (5.4) with $T_0 = t - 1$, $T = 1$, $\theta = 1/2$,

$$\int_{U'} |\nabla p(x, t)|^s dx \leq C \left(1 + \sup_{[t-1, t]} \|p\|_{L^\infty(V)}^2\right)^{s-2+a} \cdot \int_{t-1}^t \int_U (1 + K(|\nabla p|)|\nabla p|^2) dx dt. \quad (5.19)$$

(i) Taking limit superior as $t \rightarrow \infty$ and using (4.16), (3.25) give

$$\begin{aligned} \limsup_{t \rightarrow \infty} \int_{U'} |\nabla p(x, t)|^s dx &\leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))}\right)^{\mu_2} \\ &\quad \cdot \left(1 + A(\alpha)^{\frac{\alpha}{\alpha-a}} + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_1(\tau) d\tau\right). \end{aligned}$$

Then estimate (5.17) follows.

(ii) By combining (5.19) with (4.17) and (3.29), we have

$$\begin{aligned} \int_{U'} |\nabla p(x, t)|^s dx &\leq C \left\{1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \sup_{[t-2, t]} A(\alpha, \cdot)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))}\right\}^{\mu_2} \\ &\quad \cdot \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + A(\alpha, t-1)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_1(\tau) d\tau\right). \end{aligned}$$

Then (5.18) follows. $\square$

5.2 L^∞ -estimates

In this subsection, we obtain interior L^∞ -estimates for the gradient of pressure. For each $m = 1, 2, \dots, n$, denote $u_m = p_{x_m}$ and $u = (u_1, u_2, \dots, u_n) = \nabla p$. We have

$$\frac{\partial u_m}{\partial t} = \partial_m(\nabla \cdot (K(|u|)u)) = \nabla \cdot (K(|u|)\partial_m u) + \nabla \cdot \left[K'(|u|) \frac{\sum_i u_i \partial_m u_i}{|u|} u \right]. \quad (5.20)$$

Since $\partial_i u_m = \partial_m u_i$, we have $\partial_m u = (\partial_m u_1, \dots, \partial_m u_n) = (\partial_1 u_m, \dots, \partial_n u_m) = \nabla u_m$, and $\sum_i u_i \partial_m u_i = \sum_i u_i \partial_i u_m = u \cdot \nabla u_m$. Therefore, we rewrite (5.20) as

$$\frac{\partial u_m}{\partial t} = \nabla \cdot (K(|u|)\nabla u_m) + \nabla \cdot \left[K'(|u|) \frac{u \cdot \nabla u_m}{|u|} u \right]. \quad (5.21)$$

We will apply De Giorgi's technique to equation (5.21). In the following, we fix a number s_0 such that $r = s_0$ satisfies (2.20). Note that $s_0^* > 2$. We will also use s_j for $j \geq 1$ to denote some exponents that depend on s_0 but are independent of α . Let

$$s_1 = (1 - 2/s_0^*)^{-1} > 1.$$

Theorem 5.6. *Let $U' \Subset V \Subset U$. For any $T_0 \geq 0$, $T > 0$, and $\theta \in (0, 1)$, if $t \in [T_0 + \theta T, T_0 + T]$ then*

$$\|\nabla p(t)\|_{L^\infty(U')} \leq C(1 + (\theta T)^{-1})^{\frac{s_1+1}{2}} \lambda^{\frac{s_1}{2}} \|\nabla p\|_{L^2(V \times (T_0 + \theta T/2, T_0 + T))}, \quad (5.22)$$

where

$$\lambda = \lambda(T_0, T, \theta; V) = \left(\int_{T_0 + \theta T/2}^{T_0 + T} \int_V (1 + |\nabla p|)^{\frac{as_0}{2-s_0}} dx dt \right)^{\frac{2-s_0}{s_0}}. \quad (5.23)$$

and constant $C > 0$ is independent of T_0 , T , and θ .

Proof. Without loss of generality, assume $T_0 = 0$. Fix $m \in \{1, 2, \dots, n\}$. We will show for $t \in [\theta T, T]$ that

$$\|p_{x_m}(t)\|_{L^\infty(U')} \leq C(1 + (\theta T)^{-1})^{\frac{s_1+1}{2}} \lambda^{\frac{s_1}{2}} \|p_{x_m}\|_{L^2(V \times (T_0 + \theta T/2, T_0 + T))}. \quad (5.24)$$

Let $\zeta(x, t) = \phi(x)\varphi(t)$ be a cut-off function with $\varphi(t) = 0$ for $t \leq \theta T/2$, and $\text{supp } \phi \subset U$. We define for $k \geq 0$

$$u_m^{(k)} = \max\{u_m - k, 0\}, \quad S_k(t) = \{x \in U : u_m^{(k)}(x, t) \geq 0\},$$

and denote by $\chi_k(x, t)$ the characteristic function of $S_k(t)$.

Multiplying (5.21) by $u_m^{(k)} \zeta^2$ and integrating over U , we have

$$\begin{aligned} \frac{1}{2} \frac{d}{dt} \int_U |u_m^{(k)}|^2 \zeta^2 dx &= \int_U |u_m^{(k)}|^2 \zeta |\zeta_t| dx - \int_U K(|u|) |\nabla u_m^{(k)}|^2 \zeta^2 dx - 2 \int_U K(|u|) (\nabla u_m^{(k)} \cdot \nabla \zeta) u_m^{(k)} \zeta dx \\ &\quad - \int_U \frac{1}{|u|} K'(|u|) (u \cdot \nabla u_m^{(k)}) (u \cdot \nabla (u_m^{(k)} \zeta^2)) dx. \end{aligned} \quad (5.25)$$

By the product rule,

$$-\frac{1}{|u|} K'(|u|) (u \cdot \nabla u_m^{(k)}) (u \cdot \nabla (u_m^{(k)} \zeta^2)) = -\frac{1}{|u|} K'(|u|) (u \cdot \nabla u_m^{(k)}) \left(u \cdot \nabla u_m^{(k)} \zeta^2 + 2u_m^{(k)} \zeta u \cdot \nabla \zeta \right).$$

It follows property (2.12) that

$$-\frac{1}{|u|} K'(|u|) (u \cdot \nabla (u_m^{(k)})^2 \zeta^2) \leq \frac{aK(|u|)}{|u|^2} |u|^2 |\nabla u_m^{(k)}|^2 \zeta^2 = aK(|u|) |\nabla u_m^{(k)}|^2 \zeta^2$$

and

$$-\frac{2}{|u|}K'(|u|)u^2u_m^{(k)}\zeta\nabla u_m^{(k)}\cdot\nabla\zeta\leq\frac{2}{|u|}|K'(|u|)|u|^2|\nabla u_m^{(k)}||u_m^{(k)}|\zeta|\nabla\zeta|\leq CK(|u|)|\nabla u_m^{(k)}||u_m^{(k)}|\zeta|\nabla\zeta|.$$

Then we obtain from (5.25) that

$$\begin{aligned}\frac{1}{2}\frac{d}{dt}\int_U|u_m^{(k)}|^2\zeta^2&\leq\int_U|u_m^{(k)}|^2\zeta|\zeta_t|dx-(1-a)\int_UK(|u|)|\nabla u_m^{(k)}|^2\zeta^2dx\\&\quad +C\int_UK(|u|)|\nabla u_m^{(k)}||u_m^{(k)}|\zeta|\nabla\zeta|dx.\end{aligned}$$

Applying Cauchy's inequality to the last term in previous inequality yields

$$\frac{1}{2}\frac{d}{dt}\int_U|u_m^{(k)}|^2\zeta^2\leq\int_U|u_m^{(k)}|^2\zeta|\zeta_t|dx-\frac{1-a}{2}\int_UK(|u|)|\nabla u_m^{(k)}|^2\zeta^2dx+C\int_UK(|u|)|u_m^{(k)}|^2|\nabla\zeta|^2dx.$$

Since $|\zeta\nabla u_m^{(k)}|^2=|\nabla(u_m^{(k)}\zeta)-u_m^{(k)}\nabla\zeta|^2\geq\frac{1}{2}|\nabla(u_m^{(k)}\zeta)|^2-|u_m^{(k)}\nabla\zeta|^2$, we obtain

$$\begin{aligned}\frac{1}{2}\frac{d}{dt}\int_U|u_m^{(k)}\zeta|^2dx+\frac{1-a}{4}\int_UK(|u|)|\nabla(u_m^{(k)}\zeta)|^2dx\\&\leq\int_U|u_m^{(k)}|^2\zeta|\zeta_t|dx+C\int_UK(|u|)|u_m^{(k)}|^2|\nabla\zeta|^2dx.\end{aligned}\tag{5.26}$$

Integrating (5.26) from 0 to t for $t\in[0,T]$, and then taking supremum in t give

$$\begin{aligned}\max_{[0,T]}\int_U|u_m^{(k)}\zeta|^2dx+C\int_0^T\int_UK(|u|)|\nabla(u_m^{(k)}\zeta)|^2dxdt\\&\leq\int_0^T\int_U|u_m^{(k)}|^2\zeta|\zeta_t|dx+C\int_0^T\int_UK(|u|)|u_m^{(k)}|^2|\nabla\zeta|^2dxdt.\end{aligned}\tag{5.27}$$

Let

$$\nu_2=4(1-1/s_0^*)>2.\tag{5.28}$$

Applying Lemma 2.2 to function $u_m^{(k)}\zeta$ which vanishes on the boundary, weight $W=K(|u|)$ and exponents $r=s_0$, $\varrho=\varrho(s_0)=\nu_2$, we have

$$\begin{aligned}\|u_m^{(k)}\zeta\|_{L^{\nu_2}(Q_T)}&\leq C\left[\operatorname{ess\,sup}_{t\in[0,T]}\|u_m^{(k)}\zeta\|_{L^2(U)}+\left(\int_0^T\int_UK(|u|)|\nabla(u_m^{(k)}\zeta)|^2dxdt\right)^{\frac{1}{2}}\right] \\&\quad \cdot\left[\int_0^T\int_{\operatorname{supp}\zeta}K(|u|)^{-\frac{s_0}{2-s_0}}dxdt\right]^{\frac{2-s_0}{\nu_2s_0}}.\end{aligned}$$

Using (2.11), we have $K(|u|)^{-\frac{s_0}{2-s_0}}\leq C(1+|u|)^{\frac{as_0}{2-s_0}}$, hence

$$\|u_m^{(k)}\zeta\|_{L^{\nu_2}(Q_T)}\leq C\lambda^{1/\nu_2}\left[\max_{t\in[0,T]}\int_U|u_m^{(k)}\zeta|^2dx+\int_0^T\int_UK(|u|)|\nabla(u_m^{(k)}\zeta)|^2dxdt\right]^{\frac{1}{2}}.\tag{5.29}$$

By (5.29), (5.27) and the boundedness of function $K(\cdot)$ we find that

$$\begin{aligned}\|u_m^{(k)}\zeta\|_{L^{\nu_2}(Q_T)}&\leq C\lambda^{1/\nu_2}\left(\max_{[0,T]}\int_U|u_m^{(k)}\zeta|^2dx+C\int_0^T\int_UK(|u|)|\nabla(u_m^{(k)}\zeta)|^2dxdt\right)^{\frac{1}{2}}\\&\leq C\lambda^{1/\nu_2}\left(\int_0^T\int_U|u_m^{(k)}|^2\zeta|\zeta_t|dx+\int_0^T\int_U|u_m^{(k)}|^2|\nabla\zeta|^2dxdt\right)^{\frac{1}{2}}.\end{aligned}\tag{5.30}$$

Here, we use the same notation x_0 , ρ , M_0 , k_i , ρ_i , U_i , Q_i and ζ_i as introduced in the proof of Theorem 4.1 from (4.4) to (4.7). Also, the sets $A_{i,j}$ are defined by (4.6) with p being replaced by u_m .

Define $F_i = \|u_m^{(k_{i+1})}\zeta_i\|_{L^{\nu_2}(A_{i+1,i})}$. Applying (5.30) with $k = k_{i+1}$ and $\zeta = \zeta_i$ gives

$$F_i \leq C\lambda^{1/\nu_2} \left\{ \int_0^T \int_U |u_m^{(k_{i+1})}|^2 \zeta_i |(\zeta_i)_t| dx + \int_0^T \int_U |u_m^{(k_{i+1})}|^2 |\nabla \zeta_i|^2 dx dt \right\}^{1/2}. \quad (5.31)$$

Using (4.7), we obtain

$$F_i \leq C2^i \lambda^{1/\nu_2} (1 + \frac{1}{\theta T})^{1/2} \|u_m^{(k_{i+1})}\|_{L^2(A_{i+1,i})} \leq C2^i (1 + \frac{1}{\theta T})^{1/2} \lambda \|u_m^{(k_i)}\|_{L^2(A_{i,i})}.$$

Since $\nu_2 > 2$, it follows from Hölder's inequality that

$$\begin{aligned} \|u_m^{(k_{i+1})}\zeta_i\|_{L^2(A_{i+1,i+1})} &\leq \|u_m^{(k_{i+1})}\zeta_i\|_{L^{\nu_2}(A_{i+1,i+1})} |A_{i+1,i+1}|^{1/2-1/\nu_2} \\ &\leq \|u_m^{(k_{i+1})}\zeta_i\|_{L^{\nu_2}(A_{i+1,i+1})} |A_{i+1,i}|^{1/2-1/\nu_2} \leq CF_i |A_{i+1,i}|^{1/2-1/\nu_2}. \end{aligned} \quad (5.32)$$

Note that $\|u_m^{(k_i)}\|_{L^2(A_{i,i})} \geq \|u_m^{(k_i)}\|_{L^2(A_{i+1,i})} \geq (k_{i+1} - k_i) |A_{i+1,i}|^{1/2}$. Thus,

$$|A_{i+1,i}| \leq (k_{i+1} - k_i)^{-2} \|u_m^{(k_i)}\|_{L^2(A_i)}^2 \leq C4^i M_0^{-2} \|u_m^{(k_i)}\|_{L^2(A_{i,i})}^2. \quad (5.33)$$

Then it follows (5.32), (5.31) and (5.33) that

$$\begin{aligned} \|u_m^{(k_{i+1})}\|_{L^2(A_{i+1,i+1})} &\leq C2^i (1 + \frac{1}{\theta T})^{1/2} \lambda^{1/\nu_2} \|u_m^{(k_i)}\|_{L^2(A_i)} 2^{i-\frac{2i}{\nu_2}} M_0^{-1+2/\nu_2} \|u_m^{(k_i)}\|_{L^2(A_{i,i})}^{1-2/\nu_2} \\ &\leq C4^i (1 + \frac{1}{\theta T})^{1/2} \lambda^{1/\nu_2} M_0^{-1+2/\nu_2} \|u_m^{(k_i)}\|_{L^2(A_{i,i})}^{2-2/\nu_2}. \end{aligned}$$

Denote $\nu_3 = 1 - 2/\nu_2$. Let $Y_i = \|u_m^{(k_i)}\|_{L^2(A_{i,i})}$, $B = 4$ and $D = C(1 + \frac{1}{\theta T})^{1/2} \lambda^{1/\nu_2} M_0^{-\nu_3}$. We obtain

$$Y_{i+1} \leq DB^i Y_i^{1+\nu_3} \quad \text{for all } i \geq 0.$$

We now determine M_0 so that $Y_0 \leq D^{-1/\nu_3} B^{-1/\nu_3^2}$. This condition is met if

$$M_0 \geq C \left[\lambda^{1/\nu_2} (1 + \frac{1}{\theta T})^{1/2} \right]^{1/\nu_3} Y_0 = C \lambda^{s_1/2} (1 + \frac{1}{\theta T})^{\frac{1+s_1}{2}} Y_0.$$

Since $Y_0 = \|u_m^{(k_0)}\|_{L^2(A_{0,0})} \leq \|u_m\|_{L^2(V \times (\theta T/2, T))}$, it suffices to choose M_0 as

$$M_0 = C \lambda^{s_1/2} (1 + \frac{1}{\theta T})^{\frac{s_1+1}{2}} \|u_m\|_{L^2(V \times (\theta T/2, T))}. \quad (5.34)$$

Then Lemma 2.3 gives $\lim_{i \rightarrow \infty} Y_i = 0$. Hence,

$$\int_{\theta T}^T \int_{B(x_0, \rho/4)} |u_m^{(M_0)}|^2 dx dt = 0.$$

Thus, $u_m(x, t) \leq M_0$ a.e. in $B(x_0, \rho/4) \times (0, T)$. Replace u_m, u by $-u_m, -u$ and use the same argument we obtain $|u_m(x, t)| \leq M_0$ a.e. in $B(x_0, \rho/4) \times (0, T)$. Now by covering U' by finitely many such balls $B(x_0, \rho/4)$, we come to conclusion

$$|u_m(x, t)| \leq M_0 \quad \text{a.e. in } U' \times (\theta T, T). \quad (5.35)$$

By the choice of M_0 we obtain from (5.35) that

$$|u_m(x, t)| \leq C(1 + \frac{1}{\theta T})^{\frac{s_1+1}{2}} \lambda^{s_1/2} \|u_m\|_{L^2(V \times (\theta T/2, T))}$$

for all $m = 1, \dots, n$. Then (5.24) follows. $\square$

We will combine Theorem 5.6 with the high integrability of ∇p in subsection 5.1 to obtain the L^∞ -estimates. Let

$$\begin{aligned} s_2 &= \max \left\{ 2, \frac{as_0}{2-s_0} \right\}, \quad s_3 = s_1(2-s_0)/s_0 + 1, \\ \kappa_3 &= (s_2 + a - 2) \left(1 + \frac{2\kappa_1}{\alpha - a} \right), \quad \kappa_4 = 1 + s_1 + \kappa_3 s_3, \quad \kappa_5 = \kappa_2(s_2 - 2 + a). \end{aligned}$$

Theorem 5.7. *If $t \in (0, 2)$ then*

$$\begin{aligned} \|\nabla p(t)\|_{L^\infty(U')} &\leq Ct^{-\kappa_4/2} (1 + \|\bar{p}_0\|_{L^\alpha})^{s_3(\kappa_5+1)} \left(1 + EnvA(\alpha, t)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))} \right)^{s_3\kappa_5} \\ &\quad \cdot \left(1 + \int_0^t G_1(\tau) d\tau \right)^{s_3/2}. \end{aligned} \quad (5.36)$$

If $t \geq 2$ then

$$\begin{aligned} \|\nabla p(t)\|_{L^\infty(U')} &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{s_3(\kappa_5+\alpha/2)} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))} \right)^{s_3(\kappa_5+\alpha/2)} \\ &\quad \cdot \left(1 + \int_{t-1}^t G_1(\tau) d\tau \right)^{s_3/2}. \end{aligned} \quad (5.37)$$

Proof. First, we have from (5.22) that

$$\sup_{[T_0+\theta T, T_0+T]} \|\nabla p(t)\|_{L^\infty(U')} \leq C(1 + (\theta T)^{-1})^{\frac{1+s_1}{2}} \left(\int_{T_0+\theta T/2}^{T_0+T} \int_V (1 + |\nabla p|)^{s_2} dx dt \right)^{s_3/2}. \quad (5.38)$$

Let $t \in (0, 2)$, applying (5.38) with $T_0 = 0$, $T = t$, and $\theta = 1/2$, we obtain

$$\|\nabla p(t)\|_{L^\infty(U')} \leq Ct^{-\frac{1+s_1}{2}} \left(\int_{t/4}^t \int_V (1 + |\nabla p|)^{s_2} dx dt \right)^{s_3/2}. \quad (5.39)$$

We apply (5.14) with $s = s_2$ and $U' = V$. Note from formulas in (5.15) that

$$\mu_1(\alpha, s_2) = \kappa_3 + 1 \quad \text{and} \quad \mu_2(\alpha, s_2) = 2\kappa_5. \quad (5.40)$$

We obtain

$$\begin{aligned} \|\nabla p(t)\|_{L^\infty(U')} &\leq Ct^{-\frac{1+s_1}{2}} \left\{ t \cdot t^{-(\kappa_3+1)} (1 + \|\bar{p}_0\|_{L^\alpha})^{2(\kappa_5+1)} \right. \\ &\quad \cdot \left(1 + EnvA(\alpha, t)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))} \right)^{2\kappa_5} \left(1 + \int_0^t G_1(\tau) d\tau \right) \Big\}^{s_3/2} \\ &\leq Ct^{-\frac{1+s_1+\kappa_3 s_3}{2}} (1 + \|\bar{p}_0\|_{L^\alpha})^{s_3(\kappa_5+1)} \\ &\quad \cdot \left(1 + EnvA(\alpha, t)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))} \right)^{s_3\kappa_5} \left(1 + \int_0^t G_1(\tau) d\tau \right)^{s_3/2}. \end{aligned}$$

Then (5.36) follows. Let $t \geq 2$. Applying (5.38) with $T_0 = t - 3/4$, $T = 3/4$, $\theta = 2/3$, then

$$\|\nabla p(t)\|_{L^\infty(U')} \leq C \left(1 + \int_{t-1/2}^t \int_V |\nabla p|^{s_2} dx dt\right)^{s_3/2}. \quad (5.41)$$

Thanks to (5.16) with $s = s_2$, we obtain (5.37). $\square$

Combining (5.41) with Theorem 5.5, we have the following asymptotic estimates.

Theorem 5.8. (i) *If $A(\alpha) < \infty$ then*

$$\limsup_{t \rightarrow \infty} \|\nabla p(t)\|_{L^\infty(U')} \leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))}\right)^{s_3(\kappa_5 + \alpha/2)} \cdot \left(1 + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_1(\tau) d\tau\right)^{s_3/2}. \quad (5.42)$$

(ii) *If $\beta(\alpha) < \infty$ then there is $T > 0$ such that when $t > T$ we have*

$$\|\nabla p(t)\|_{L^\infty(U')} \leq C \left(1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \sup_{[t-3, t]} A(\alpha, \cdot)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-3, t))}\right)^{s_3(\kappa_5 + \alpha/2)} \cdot \left(1 + \int_{t-2}^t G_1(\tau) d\tau\right)^{s_3/2}. \quad (5.43)$$

6 Interior estimates for time derivative of pressure

In this section, we estimate the L^∞ -norm of $p_t(x, t)$ for $t > 0$. Let $q = p_t$. Then

$$\frac{\partial q}{\partial t} = \nabla \cdot (K(|\nabla p|) \nabla p)_t. \quad (6.1)$$

Using (6.1), we first derive a local-in-time estimate for L^∞ -norm of p_t .

Proposition 6.1. *Let $U' \Subset V \Subset U$. If $T_0 \geq 0$, $T > 0$ and $\theta \in (0, 1)$, then*

$$\sup_{[T_0 + \theta T, T_0 + T]} \|p_t\|_{L^\infty(U')} \leq C \lambda^{\frac{s_1}{2}} (1 + (\theta T)^{-1})^{\frac{s_1+1}{2}} \|p_t\|_{L^2(U \times (T_0, T_0 + T))}, \quad (6.2)$$

where s_1 and $\lambda = \lambda(T_0, T, \theta; V)$ are defined in Theorem 5.6, and constant $C > 0$ is independent of T_0 , T , and θ .

Proof. Without loss of generality, assume $T_0 = 0$. For $k \geq 0$, let $q^{(k)} = \max\{q - k, 0\}$ and $S_k(t) = \{x \in U : q(x, t) > k\}$, and $\chi_k(x, t)$ be the characteristic function of set $\{(x, t) \in U \times (0, T) : q(x, t) > k\}$. On $S_k(t)$, we have $(\nabla p)_t = \nabla q = \nabla q^{(k)}$.

Let $\zeta = \zeta(x, t)$ be the cut-off function on $U \times [0, T]$ satisfying $\zeta(\cdot, 0) = 0$ and $\zeta(\cdot, t)$ having compact support in U . We will use test function $q^{(k)} \zeta^2$, noting that $\nabla(q^{(k)} \zeta^2) = \zeta[\nabla(q^{(k)} \zeta) + q^{(k)} \nabla \zeta]$. Multiplying (6.1) by $q^{(k)} \zeta^2$ and integrating the resultant on U , we get

$$\begin{aligned} \frac{1}{2} \frac{d}{dt} \int_U |q^{(k)} \zeta|^2 dx &= \int_U |q^{(k)}|^2 \zeta \zeta_t dx - \int_U (K(|\nabla p|))_t \nabla p \cdot [\nabla(q^{(k)} \zeta) + q^{(k)} \nabla \zeta] \zeta dx \\ &\quad - \int_U K(|\nabla p|) (\nabla p)_t \cdot [\nabla(q^{(k)} \zeta) + q^{(k)} \nabla \zeta] \zeta dx. \end{aligned} \quad (6.3)$$

For the last integral of (6.3), put $z = \zeta[\nabla(q^{(k)}\zeta) + q^{(k)}\nabla\zeta]$. We have

$$(\nabla p)_t \cdot z = \zeta \nabla q^{(k)} \cdot [\nabla(q^{(k)}\zeta) + q^{(k)}\nabla\zeta] = |\nabla(q^{(k)}\zeta)|^2 - |q^{(k)}\nabla\zeta|^2.$$

For the second integral on the right-hand side of (6.3), taking into account (2.12),

$$|(K(|\nabla p|))_t \nabla p \cdot z| = |K'(|\nabla p|)|\frac{|\nabla p \cdot \nabla p_t|}{|\nabla p|}|\nabla p \cdot z| \leq aK(|\nabla p|)|\nabla q||z|.$$

Note that

$$\begin{aligned} |\nabla q||z| &= |\zeta \nabla \bar{q}^{(k)}| |\nabla(q^{(k)}\zeta) + q^{(k)}\nabla\zeta| \leq \{|\nabla(q^{(k)}\zeta)| + |q^{(k)}||\nabla\zeta|\}^2 \\ &= |\nabla(q^{(k)}\zeta)|^2 + 2|q^{(k)}||\nabla\zeta||\nabla(q^{(k)}\zeta)| + |q^{(k)}\nabla\zeta|^2, \end{aligned}$$

and by applying Cauchy's inequality to the second to last term

$$a|\nabla q||z| \leq a|\nabla(q^{(k)}\zeta)|^2 + \frac{1-a}{2}|\nabla(q^{(k)}\zeta)|^2 + \frac{2a^2}{1-a}|\bar{q}^{(k)}\nabla\zeta|^2 + a|q^{(k)}\nabla\zeta|^2.$$

It follows the above calculations that

$$\begin{aligned} \frac{d}{dt} \int_U |q^{(k)}\zeta|^2 dx + (1-a) \int_U K(|\nabla p|)|\nabla(q^{(k)}\zeta)|^2 dx \\ \leq 2 \int_U |q^{(k)}|^2 \zeta |\zeta_t| dx + C \int_U K(|\nabla p|)|q^{(k)}\nabla\zeta|^2 dx. \end{aligned}$$

Integrating this inequality from 0 to T , we obtain

$$\begin{aligned} \max_{[0,T]} \int_U |q^{(k)}\zeta|^2 dx + \int_0^T \int_U K(|\nabla p|)|\nabla(q^{(k)}\zeta)|^2 dx dt \\ \leq C \left[\int_0^T \int_U |q^{(k)}|^2 \zeta |\zeta_t| dx dt + \int_0^T \int_U K(|\nabla p|)|q^{(k)}\nabla\zeta|^2 dx dt \right] \\ \leq C \int_0^T \int_U |q^{(k)}|^2 (\zeta |\zeta_t| + |\nabla\zeta|^2) dx dt. \end{aligned}$$

The last inequality uses the fact that function $K(\cdot)$ is bounded above. Applying Lemma 2.2 to $q^{(k)}\zeta$ with $W = K(|\nabla p|)$ and $\varrho = \nu_2$ defined by (5.28), we have

$$\|q^{(k)}\zeta\|_{L^{\nu_2}(Q_T)} \leq C\lambda^{1/\nu_2} \cdot \left\{ \max_{[0,T]} \int_U |q^{(k)}\zeta|^2 dx + \int_0^T \int_U K(|\nabla p|)|\nabla(q^{(k)}\zeta)|^2 dx dt \right\}^{1/2}.$$

and hence,

$$\|q^{(k)}\zeta\|_{L^{\nu_2}(Q_T)} \leq C\lambda^{1/\nu_2} \left\{ \int_0^T \int_U |q^{(k)}|^2 (|\zeta_t|\zeta + |\nabla\zeta|^2) dx dt \right\}^{1/2}. \quad (6.4)$$

This is similar to inequality (5.30). Then by following arguments of Theorem 5.6 applied for $q^{(k)}$ instead of $u_m^{(k)}$, we obtain (6.2). The proof is complete. $\square$

The next theorem contains the estimates in terms of the initial and boundary data for all $t > 0$. Let

$$\begin{aligned} \kappa_6 &= 1 + s_1 + \kappa_3(s_3 - 1), \quad \kappa_7 = (s_3 - 1)(\kappa_5 + 1) + 1, \\ \kappa_8 &= (s_3 - 1)\kappa_5, \quad \kappa_9 = (s_3 - 1)(\kappa_5 + \alpha/2) + \alpha/2. \end{aligned}$$

Theorem 6.2. *Let $U' \Subset U$. For $t \in (0, 2)$,*

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} &\leq Ct^{-\kappa_6/2} \left(1 + \|\bar{p}_0\|_{L^\alpha}\right)^{\kappa_7} \left(1 + \int_U H(|\nabla p_0(x)|) dx\right)^{1/2} \\ &\quad \cdot \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))}\right)^{\kappa_8} \left(1 + \int_0^t G_3(\tau) d\tau\right)^{s_3/2}. \end{aligned} \quad (6.5)$$

For $t \geq 2$,

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{\kappa_9} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))}\right)^{\kappa_9} \\ &\quad \cdot \left(1 + \int_{t-1}^t G_3(\tau) d\tau\right)^{s_3/2}. \end{aligned} \quad (6.6)$$

Proof. Let $t \in (0, 2)$, apply (6.2) with $T_0 = 0$, $T = t$ and $\theta = 1/2$. By (5.23) and (5.3), we have

$$\lambda^{s_1/2} = \left(\int_{t/2}^t \int_V (1 + |\nabla p|)^{\frac{as_0}{2-s_0}} dx d\tau \right)^{\frac{(2-s_0)s_1}{2s_0}} \leq \left(\int_{t/2}^t \int_V (1 + |\nabla p|)^{s_2} dx d\tau \right)^{\frac{\nu_4}{2}},$$

where

$$\nu_4 = (2 - s_0)s_1/s_0 = s_3 - 1. \quad (6.7)$$

By (5.14) and relation (5.40),

$$\begin{aligned} \lambda^{s_1/2} &\leq C \left\{ t \cdot t^{-(\kappa_3+1)} (1 + \|\bar{p}_0\|_{L^\alpha})^{2(\kappa_5+1)} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))}\right)^{2\kappa_5} \right. \\ &\quad \cdot \left. \left(1 + \int_0^t G_1(\tau) d\tau\right)^{\nu_4/2} \right\} \leq Ct^{\frac{-\kappa_3\nu_4}{2}} (1 + \|\bar{p}_0\|_{L^\alpha})^{(\kappa_5+1)\nu_4} \\ &\quad \cdot \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))}\right)^{\kappa_5\nu_4} \left(1 + \int_0^t G_1(\tau) d\tau\right)^{\nu_4/2}. \end{aligned}$$

Combining this with (6.2) and (3.9) gives

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} &\leq C\lambda^{\frac{s_1}{2}} t^{-\frac{1+s_1}{2}} \|p_t\|_{L^2(U \times (0, t))} \\ &\leq Ct^{\frac{-\kappa_3\nu_4-(1+s_1)}{2}} (1 + \|\bar{p}_0\|_{L^\alpha})^{(\kappa_5+1)\nu_4} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))}\right)^{\kappa_5\nu_4} \\ &\quad \cdot \left(1 + \int_0^t G_1(\tau) d\tau\right)^{\nu_4/2} \\ &\quad \cdot \left(\int_U [H(|\nabla p_0(x)|) + \bar{p}_0^2(x)] dx + \int_0^t G_3(\tau) d\tau + \int_0^t \int_U |\Psi_t(x, \tau)|^2 dx d\tau \right)^{1/2}. \end{aligned}$$

Therefore,

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} &\leq Ct^{-\kappa_6/2} \left(1 + \|\bar{p}_0\|_{L^\alpha}\right)^{(\kappa_5+1)\nu_4+1} \left(1 + \int_U H(|\nabla p_0(x)|) dx\right)^{1/2} \\ &\quad \cdot \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))}\right)^{\kappa_5\nu_4} \left(1 + \int_0^t G_3(\tau) d\tau\right)^{(\nu_4+1)/2}. \end{aligned}$$

We obtain (6.5).

Now consider $t \geq 2$. We apply (6.2) with $T_0 = t - 1$, $T = 1$ and $\theta = 1/2$. Then by (5.23) and (5.16),

$$\begin{aligned} \lambda^{s_1/2} &\leq C \left(\int_{t-1}^t \int_V (1 + |\nabla p|)^{s_2} dx d\tau \right)^{\nu_4/2} \\ &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{\nu_4(\kappa_5 + \alpha/2)} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))} \right)^{\nu_4(\kappa_5 + \alpha/2)} \\ &\quad \cdot \left(1 + \int_{t-1}^t G_1(\tau) d\tau \right)^{\nu_4/2}. \end{aligned}$$

Combining this with (6.2) and (3.22) gives

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} &\leq C \lambda^{\frac{s_1}{2}} \|p_t\|_{L^2(U \times (t-1/2, t))} \\ &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{\nu_4(\kappa_5 + \alpha/2)} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))} \right)^{\nu_4(\kappa_5 + \alpha/2)} \\ &\quad \cdot \left(1 + \int_{t-1}^t G_1(\tau) d\tau \right)^{\nu_4/2} \cdot \left(1 + \int_U |\bar{p}_0(x)|^\alpha dx + [EnvA(\alpha, t)]^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_3(\tau) d\tau \right)^{1/2}. \end{aligned}$$

Thus,

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{\nu_4(\kappa_5 + \alpha/2) + \alpha/2} \\ &\quad \cdot \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))} \right)^{\nu_4(\kappa_5 + \alpha/2) + \alpha/2} \left(1 + \int_{t-1}^t G_3(\tau) d\tau \right)^{\nu_4/2 + 1/2}, \end{aligned}$$

and we obtain (6.6). The proof is complete. $\square$

For large time or asymptotic estimates, we have:

Theorem 6.3. *Let $U' \Subset U$.*

(i) *If $A(\alpha) < \infty$ then*

$$\begin{aligned} \limsup_{t \rightarrow \infty} \|p_t(t)\|_{L^\infty(U')} &\leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\kappa_9} \\ &\quad \cdot \left(1 + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_3(\tau) d\tau \right)^{s_3/2}. \end{aligned} \tag{6.8}$$

(ii) *If $\beta(\alpha) < \infty$ then there is $T > 0$ such that for all $t > T$,*

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} &\leq C \left(1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \sup_{[t-3, t]} A(\alpha, \cdot)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-3, t))} \right)^{\kappa_9} \\ &\quad \cdot \left(1 + \int_{t-2}^t G_3(\tau) d\tau \right)^{s_3/2}. \end{aligned} \tag{6.9}$$

Proof. (i) For large t , we apply (6.2) with $T_0 = t - 1$, $T = 1$ and $\theta = 1/2$. We have

$$\|p_t(t)\|_{L^\infty(U')} \leq C \lambda^{s_1/2} \|p_t\|_{L^2(U \times (t-1/2, t))} \leq C \left(\int_{t-1}^t \int_V (1 + |\nabla p|)^{s_2} dx d\tau \right)^{\nu_4/2} \|p_t\|_{L^2(U \times (t-1/2, t))}, \tag{6.10}$$

where ν_4 is defined by (6.7). Take the limit superior and using (5.17) with $s = s_2$, and (3.26), we obtain

$$\begin{aligned} & \limsup_{t \rightarrow \infty} \|p_t(t)\|_{L^\infty(U')} \\ & \leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\nu_4(\kappa_5 + \alpha/2)} \left(1 + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_1(\tau) d\tau \right)^{\nu_4/2} \\ & \quad \cdot \left(1 + A(\alpha)^{\frac{\alpha}{\alpha-a}} + \limsup_{t \rightarrow \infty} \int_{t-1}^t \int_U |\Psi_t(x, \tau)|^2 dx d\tau + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_3(\tau) d\tau \right)^{1/2} \\ & \leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))} \right)^{\nu_4(\kappa_5 + \alpha/2) + \alpha/2} \left(1 + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_3(\tau) d\tau \right)^{\nu_4/2 + 1/2}. \end{aligned}$$

We obtain (6.8).

(ii) Using (6.10), (5.18), and (3.30), we obtain

$$\begin{aligned} \|p_t(t)\|_{L^\infty(U')} & \leq C \left(1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \sup_{[t-3, t]} A(\alpha, \cdot)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-3, t))} \right)^{\nu_4(\kappa_5 + \alpha/2)} \left(1 + \int_{t-2}^t G_1(\tau) d\tau \right)^{\nu_4/2} \\ & \quad \cdot \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + A(\alpha, t-1)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t \int_U |\Psi_t(x, \tau)|^2 dx d\tau + \int_{t-1}^t G_3(\tau) d\tau \right)^{1/2}. \end{aligned}$$

Therefore (6.9) follows. $\square$

7 Interior estimates for pressure's Hessian

In this section, we estimate the L^2 -norm of the Hessian $\nabla^2 p = (p_{x_i x_j})_{i,j=1,2,\dots,n}$.

Lemma 7.1. *Let $U' \Subset V \Subset U$. For $t > 0$,*

$$\|\nabla^2 p(t)\|_{L^2(U')} \leq C \left(1 + \|\nabla p(t)\|_{L^\infty(V)} \right)^a \left(\int_U [|\nabla p|^{2-a} + |p_t|^2] dx \right)^{1/2}. \quad (7.1)$$

Proof. From (5.2) of Lemma 5.2 with $\zeta = \zeta(x)$ being a cut-off function in space, we have

$$\begin{aligned} & \frac{1}{2s+2} \frac{d}{dt} \int_U |\nabla p|^{2s+2} \zeta^2 dx + \frac{1-a}{2} \int_U K(|\nabla p|) |\nabla^2 p|^2 |\nabla p|^{2s} \zeta^2 dx \\ & \leq C \int_U K(|\nabla p|) |\nabla p|^{2s+2} |\nabla \zeta|^2 dx. \end{aligned} \quad (7.2)$$

Clearly,

$$\frac{1}{2s+2} \frac{d}{dt} \int_U |\nabla p|^{2s+2} \zeta^2 dx = - \int_U p_t \nabla \cdot (|\nabla p|^{2s} \nabla p \zeta^2) dx. \quad (7.3)$$

Combining (7.2) and (7.3) with $s = 0$, we have

$$\int_U K(|\nabla p|) |\nabla^2 p|^2 \zeta^2 dx \leq C \int_U K(|\nabla p|) |\nabla p|^2 |\nabla \zeta|^2 dx + C \int_U |p_t \nabla \cdot (\nabla p \zeta^2)| dx.$$

Since

$$\begin{aligned} |p_t \nabla \cdot (\nabla p \zeta^2)| & \leq |p_t| |\nabla^2 p| \zeta^2 + 2|p_t| |\nabla p| \zeta |\nabla \zeta| \\ & \leq 1/2 K(|\nabla p|) |\nabla^2 p|^2 \zeta^2 + C K(|\nabla p|) |\nabla p|^2 |\nabla \zeta|^2 + C |p_t|^2 K^{-1}(|\nabla p|) \zeta^2, \end{aligned}$$

and, by (2.11), $K^{-1}(\xi) \leq C(1 + \xi)^a$ we find that

$$\int_U K(|\nabla p|)|\nabla^2 p|^2 \zeta^2 dx \leq C \int_U K(|\nabla p|)|\nabla p|^2 |\nabla \zeta|^2 dx + C \int_U |p_t|^2 (1 + |\nabla p|)^a \zeta^2 dx. \quad (7.4)$$

Constructing appropriate ζ in (7.4) with $\zeta \equiv 1$ on U' and $\text{supp } \zeta \subset V$ we obtain

$$\int_{U'} K(|\nabla p|)|\nabla^2 p|^2 dx \leq C(1 + \|\nabla p\|_{L^\infty(V)})^a \int_V [|\nabla p|^{2-a} + |p_t|^2] dx. \quad (7.5)$$

For $x \in U'$,

$$K(|\nabla p|) \geq C(1 + |\nabla p|)^{-a} \geq C((1 + \|\nabla p\|_{L^\infty(V)})^{-a}) \quad (7.6)$$

From (7.5), (7.6) and Young's inequality we obtain (7.1). $\square$

Now, we combine Lemma 7.1 with estimates in section 3 and subsection 5.2 to obtain particular bounds for the Hessian. Let

$$\begin{aligned} s_4 &= as_3 + 1, \\ \kappa_{10} &= a\kappa_4 + 1, \quad \kappa_{11} = as_3(\kappa_5 + \alpha/2) + \alpha/2, \quad \kappa_{12} = as_3\kappa_5 + \alpha/2. \end{aligned}$$

Theorem 7.2. *Let $U' \Subset U$.*

(i) *If $t \in (0, 2)$ then*

$$\begin{aligned} \|\nabla^2 p(t)\|_{L^2(U')} &\leq Ct^{-\kappa_{10}/2} (1 + \|\bar{p}_0\|_{L^\alpha})^{\kappa_{11}} \left(1 + \int_U H(|\nabla p_0(x)|) dx\right)^{1/2} \\ &\quad \cdot \left(1 + EnvA(\alpha, t)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0, t))}\right)^{\kappa_{12}} \left(1 + \int_0^t G_4(\tau) d\tau\right)^{s_4/2}. \end{aligned} \quad (7.7)$$

(ii) *If $t \geq 2$ then*

$$\begin{aligned} \|\nabla^2 p(t)\|_{L^2(U')} &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{\kappa_{11}} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2, t))}\right)^{\kappa_{11}} \\ &\quad \cdot \left(1 + \int_{t-1}^t G_4(\tau) d\tau\right)^{s_4/2}. \end{aligned} \quad (7.8)$$

(iii) *If $A(\alpha) < \infty$ then*

$$\begin{aligned} \limsup_{t \rightarrow \infty} \|\nabla^2 p\|_{L^2(U')} &\leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1, t))}\right)^{\kappa_{11}} \\ &\quad \cdot \left(1 + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_4(\tau) d\tau\right)^{s_4/2}. \end{aligned} \quad (7.9)$$

(iv) *If $\beta(\alpha) < \infty$ then there is $T > 0$ such that for $t > T$,*

$$\begin{aligned} \|\nabla^2 p(t)\|_{L^2(U')} &\leq C \left(1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \sup_{[t-3, t]} A(\alpha, \cdot)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-3, t))}\right)^{\kappa_{11}} \\ &\quad \cdot \left(1 + \int_{t-2}^t G_4(\tau) d\tau\right)^{s_4/2}. \end{aligned} \quad (7.10)$$

Proof. (i) Using (7.1), (5.36), (3.9) and (3.11):

$$\begin{aligned} \|\nabla^2 p(t)\|_{L^2(U')} &\leq Ct^{-a\kappa_4/2} (1 + \|\bar{p}_0\|_{L^\alpha})^{as_3(\kappa_5+1)} \left(1 + EnvA(\alpha, t)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (0,t))}\right)^{as_3\kappa_5} \\ &\quad \cdot \left(1 + \int_0^t G_1(\tau) d\tau\right)^{as_3/2} \left\{ t^{-1} \left(1 + \int_U |\bar{p}_0(x)|^\alpha dx + \int_U H(|\nabla p_0(x)|) dx \right. \right. \\ &\quad \left. \left. + [EnvA(\alpha, t)]^{\frac{\alpha}{\alpha-a}} + \int_U |\Psi_t(x, t)|^2 dx + \int_0^t G_4(\tau) d\tau \right) \right\}^{1/2}. \end{aligned}$$

Note that $\alpha \geq 2$, and

$$\int_U |\Psi_t(x, t)|^2 dx \leq C \left(\int_U |\Psi_t(x, t)|^\alpha dx \right)^{\frac{2}{\alpha}} \leq CA(\alpha, t)^{\frac{2(1-a)}{\alpha-a}} \leq C(1 + A(\alpha, t)^{\frac{\alpha}{\alpha-a}}).$$

Then (7.7) follows.

(ii) Using (7.1), (5.37), (3.13), (3.14) and (3.5):

$$\begin{aligned} \|\nabla^2 p(t)\|_{L^2(U')} &\leq C(1 + \|\bar{p}_0\|_{L^\alpha})^{as_3(\kappa_5+\alpha/2)} \left(1 + [EnvA(\alpha, t)]^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-2,t))}\right)^{as_3(\kappa_5+\alpha/2)} \\ &\quad \cdot \left(1 + \int_{t-1}^t G_1(\tau) d\tau\right)^{as_3/2} \\ &\quad \cdot \left(1 + \int_U |\bar{p}_0(x)|^\alpha dx + [EnvA(\alpha, t-1)]^{\frac{\alpha}{\alpha-a}} + \int_U |\Psi_t(x, t-1)|^2 dx + \int_{t-1}^t G_4(\tau) d\tau\right)^{1/2}. \end{aligned}$$

Then (7.8) follows.

(iii) Using (7.1), (5.42), (3.23) and (3.24):

$$\begin{aligned} \limsup_{t \rightarrow \infty} \|\nabla^2 p\|_{L^2(U')} &\leq C \left(1 + A(\alpha)^{\frac{1}{\alpha-a}} + \limsup_{t \rightarrow \infty} \|\Psi\|_{L^\alpha(U \times (t-1,t))}\right)^{as_3(\kappa_5+\alpha/2)} \\ &\quad \cdot \left(1 + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_1(\tau) d\tau\right)^{as_3/2} \left(1 + A(\alpha)^{\frac{\alpha}{\alpha-a}} + \limsup_{t \rightarrow \infty} \int_U |\Psi_t(x, t)|^2 dx + \limsup_{t \rightarrow \infty} \int_{t-1}^t G_4(\tau) d\tau\right)^{1/2}. \end{aligned}$$

Then (7.9) follows.

(iv) Using (7.1), (5.43), (3.27) and (3.28):

$$\begin{aligned} \|\nabla^2 p(t)\|_{L^2(U')} &\leq C \left(1 + \beta(\alpha)^{\frac{1}{\alpha-2a}} + \sup_{[t-3,t]} A(\alpha, \cdot)^{\frac{1}{\alpha-a}} + \|\Psi\|_{L^\alpha(U \times (t-3,t))}\right)^{as_3(\kappa_5+\alpha/2)} \\ &\quad \cdot \left(1 + \int_{t-2}^t G_1(\tau) d\tau\right)^{as_3/2} \left(1 + \beta(\alpha)^{\frac{\alpha}{\alpha-2a}} + A(\alpha, t-1)^{\frac{\alpha}{\alpha-a}} + \int_{t-1}^t G_4(\tau) d\tau + \int_U |\Psi_t(x, t)|^2 dx\right)^{1/2}. \end{aligned}$$

Then (7.10) follows. $\square$

A Appendix

Proof of Lemma 2.1. In this proof, we use notation $\|\cdot\|_{L^p}$ to denote $\|\cdot\|_{L^p(U)}$. First, we have the following Poincaré-Sobolev inequality

$$\|\phi\|_{L^{r^*}} \leq C \|\nabla \phi\|_{L^r} + C \delta \|\phi\|_{L^1}. \quad (\text{A.1})$$

Let $r = 2 - a$ and $\phi = |u|^m$, where $m = (\alpha - a)/(2 - a) \geq 1$. Applying (A.1) to ϕ , we obtain

$$\|u\|_{L^{mr^*}} \leq C \left(\int_U |u|^{\alpha-2} |\nabla u|^{2-a} dx \right)^{\frac{1}{\alpha-a}} + C\delta \|u\|_{L^m} \leq C \left(\int_U |u|^{\alpha-2} |\nabla u|^{2-a} dx \right)^{\frac{1}{\alpha-a}} + C\delta \|u\|_{L^\alpha}. \quad (\text{A.2})$$

The last inequality comes from Hölder's inequality and the fact $\alpha > m$. Consider a number $p \in (\alpha, mr^*)$. Let $\theta \in (0, 1)$ such that

$$\frac{1}{p} = \frac{\theta}{\alpha} + \frac{1-\theta}{mr^*}. \quad (\text{A.3})$$

Combining interpolation inequality and (A.2) yields

$$\begin{aligned} \|u\|_{L^p}^p &\leq \|u\|_{L^\alpha}^{\theta p} \|u\|_{L^{mr^*}}^{(1-\theta)p} \leq C \|u\|_{L^\alpha}^{\theta p} \left\{ \left(\int_U |u|^{\alpha-2} |\nabla u|^{2-a} dx \right)^{\frac{1}{\alpha-a}} + C\delta \|u\|_{L^\alpha} \right\}^{(1-\theta)p} \\ &\leq C\delta \|u\|_{L^\alpha}^p + \|u\|_{L^\alpha}^{\theta p} \left(\int_U |u|^{\alpha-2} |\nabla u|^{2-a} dx \right)^{\frac{(1-\theta)p}{\alpha-a}}. \end{aligned}$$

In the preceding inequality, selecting $(1-\theta)p = \alpha - a$, letting $u = u(x, t)$, and integrating in t from 0 to T give

$$\begin{aligned} \int_0^T \|u(t)\|_{L^p}^p dt &\leq C\delta T \operatorname{ess\,sup}_{[0,T]} \|u\|_{L^\alpha}^p + C \operatorname{ess\,sup}_{[0,T]} \|u\|_{L^\alpha}^{\theta p} \int_0^T \int_U |u|^{\alpha-2} |\nabla u|^{2-a} dx dt \\ &\leq C\delta T [[u]]^p + C [[u]]^{\theta p} [[u]]^{(1-\theta)p} = C(1 + \delta T) [[u]]^p. \end{aligned}$$

Therefore (2.17) follows. It remains to calculate p and check sufficient conditions. Note that $\theta p = p - \alpha + a$, and from (A.3), we derive

$$1 = \frac{\theta p}{\alpha} + \frac{(1-\theta)p}{mr^*} = \frac{p - \alpha + a}{\alpha} + \frac{\alpha - a}{mr^*}.$$

Solving for p from this gives $p = \alpha + (\alpha - a)(1 - \frac{\alpha}{mr^*})$. Simple calculations yield p in the form of (2.16). It is elementary to verify that the second condition in (2.15) guarantees $\alpha < p < mr^*$.

In case U is a ball $B_R(x_0)$, the inequality with (2.19) follows from the scaling $y = (x - x_0)/R$ for $x \in B_R(x_0)$ and (2.17) for $B_1(0)$. $\square$
